

Build a Winning Proposal, End-to-End

The complete customer manual: every feature of your proposal portal, in the order you use it — rank opportunities, build a content library, draft a proposal from your atoms in the canvas, lock the matrix, and export submission-ready files.

Every step was verified on a real effort: the **Immobileyes NAVAIR/NAVSEA Counter-UAS SBIR** (topic DON26BX03-NP002). The screenshots are that live run.

Complete surface · every feature, screen, and control — verified on a live build

► What changed

Your portal — orientation

WHERE

/portal/<company>/dashboard

Welcome to your company's proposal portal. This guide walks every feature you have as a **Customer Admin**, in the order you use them — from a ranked opportunity to a submission-ready, downloadable proposal. Sign in with the credentials your RFP-Pipeline admin issued; you land on your **Dashboard**.

The customer portal — your workspace, ToDos, and quick actions.

The sidebar & global chrome

The left sidebar is your map. It shows your company name, a notification bell, and your name up top; every workspace below.

The **notification bell** polls every 60s and badges unread (or **9+**). Open it and hit **Mark all read** to clear the badge — your read position is remembered per-user, so a teammate’s reading doesn’t clear yours. If an RFP admin is working inside your company on your behalf, an amber **shadow-admin banner** shows at the top — everything they do is logged to your audit trail.

Your portal sidebar.

Sidebar map

Label	Route	What it is
Dashboard	/dashboard	home — stats, ToDos, quick actions
Opportunities	/cards	your ranked opportunity pipeline
Buckets	/buckets	your scoring lenses

Billing	/billing	subscription & purchases
AI Usage	/agents	your agent usage & budget
Automation	/automation	your automation preferences
Settings	/profile	your company profile

The Dashboard — home base

WHERE /portal/<company>/dashboard

Your dashboard is role-aware: quick stats, your ToDo queue, an **Add content** dropzone, a getting-started checklist, and recent activity.

A **trial banner** appears if your trial is ending — it turns red within 7 days and links to Billing so you keep your data.

- 1 Check the **three stat cards** (Library Units · Active Proposals · Pinned Topics) — each links to its screen.
- 2 Work **Your To-Dos**. Each card shows an urgency chip, a workflow pill, a step trail, and a typed action (Acknowledge / Approve-Done / Open-to-upload / a form).

Your To-Dos

The ToDo queue on your dashboard.

- 3 Drop a file on **Add content** to upload & atomize it straight into your library.
- 4 Tick off the **Get Started** checklist (upload docs · set up profile · create a bucket · purchase a portal).

☐ Set up your company profile

☒ Create your first Spotlight

☒ Purchase your first proposal portal

Opportunities — your ranked pipeline

WHERE `/portal/<company>/cards`

The **Opportunity Pipeline** is every opportunity the platform has released to you — a complete mirror, ranked by your Spotlight buckets. Rate an opportunity 👍 or 👎; a 👍 reveals **View Solicitation**, which copies the documents into your library so you can read them with our analysts' highlights.

Your list is complete, always. Every opportunity the RFP team has released is in it, for every customer. Your 👍 and 👎 change the ORDER and what you see by default — they never remove anything, and they never hide an opportunity from anyone else.

- 1 Toggle **Include closed** to widen the list, **Show passed** to bring back what you rated 👎; **Refresh** re-pulls; the count shows how many cards you have.
- 2 Read a card: title, a **submission-stage badge** (NOFO / Pre-Release / Updated / Closed), agency, program type, and the close date. Below that is what our RFP team found — the summary, technology areas, the award size, and how much work the solicitation asks for (7-page technical · 2 volumes). **What our analysts found** opens their marked passages, with page numbers.

Pin (copy docs)

A card's stage badge, curated record and actions.

- 3 👍 says this one interests you. It is a verdict and nothing else — nothing is downloaded, nothing is bought. It sorts the opportunity up your list, lets us nudge you before it closes, and teaches your ranking: opportunities that look like the ones you rated 👍 arrive nearer the top.
- 4 👎 says it is not a fit. It sorts to the bottom and drops out of your default view. **Nothing is deleted** — the opportunity stays in your list and keeps updating, so if an advisor later tells you to pursue it, it is still there and still current. Click 👎 again to undo.
- 5 A 👍 reveals **View Solicitation**. That is the one that moves files: it copies the published documents into your library and opens them with our analysts' highlights and notes alongside. Rating is free; copying happens when you actually want to read.

Pin (copy docs)

A 👍 card, showing View Solicitation and Purchase.

- 6 An **Update available** strip offers **Resync** when the RFP changes after you copied it.

The opportunity pipeline — ranked cards showing what the RFP team found, with 👍 / 👎 on each.

Purchasing a proposal workspace

The green **Purchase** button sits beside **View Solicitation** on an opportunity you have rated 👍. You can buy at any time — the rating is not a prerequisite, just where the button naturally lives.

In the verified run, the NAVAIR/NAVSEA C-UAS topic **DON26BX03-NP002** ranked **#1** for Immobileyes — the best fit for a counter-drone optics company.

- 1 The modal states what you are buying into before it asks for money: the **close date** (in red if it has passed), the **page limit**, the number of **volumes**, the submission format, and how many **required items** the build has.
- 2 If our RFP team has finished the build-out, the modal says **Build-out complete** — your workspace opens with the compliance matrix, volumes and section molds already in place.
- 3 The offer is a one-time **expert-curated proposal build**. **Pay by card** runs Stripe checkout, or use an **Access / discount code**.
- 4 Enter your comp code (e.g. `rfppipelinetest`) and **Complete purchase**. The build opens in `curation_pending` — an RFP admin then releases it (72h SLA), provisioning your matrix and molds.

The card detail — Overview / Origin / Compliance tabs.

Buckets — your scoring lenses

WHERE `/portal/<company>/buckets`

Spotlight **buckets** are your scoring criteria — the themes you care about. Each bucket ranks the whole pipeline by your rules, and editing one re-ranks your Opportunities automatically.

Your bucket list starts **empty** — the lenses are yours to author, because a starter set built for somebody else ranks somebody else's pipeline. **Start from our company profile** fills the form from the NAICS codes, keywords and agencies you already gave us, so the first bucket costs a click rather than a memory test. There is a platform budget of 25 buckets per company; if you reach it the product says so and asks you to delete one first.

Your 👍 and 👎 rank alongside your buckets. Once you have rated a few opportunities, ones sharing the attributes you liked — the same agency, programme, or technology area — score higher before you have looked at them, and ones like those you rejected score lower. A technology match counts for more than “it is an SBIR”, which nearly every opportunity is.

- 1 **Start from our company profile.** One click fills keywords, NAICS codes and agencies from the profile you already completed. It **FILLS** rather than replaces — anything you have already typed is left alone.
- 2 In **New bucket**, set a Name plus any of keywords, agencies, program types, and NAICS codes; tick **Include closed opportunities** if you want them scored. Click **Create**.

Create

Creating a scoring bucket.

- 3 Click **Rank** → on a bucket to see your pipeline ordered #1, #2, ... with each opportunity's score and per-factor chips (e.g. keyword 3).

A bucket with its Rank control.

- 4 Delete a bucket with its ✕. Ranking is deterministic today; an optional scoring agent overlays it later.
- 5 As you type, the form tells you what the lens will actually score on: Scores on 4 signals: 1 keyword 29%, NAICS codes 29%, agency 29%, closing date 14%. Those percentages come from the same weight table the scorer uses, so they cannot drift from your real result.
- 6 Underneath is the line worth reading twice — **Reach**: NAICS codes 0/9 · agency 9/9 · closing date 6/9. It counts how many of YOUR opportunities each criterion can actually reach. A criterion at 29% of your score that reaches none of them is doing nothing, and the form says so in amber rather than letting the percentage imply otherwise.

Scores on 4 signals: 1 keyword 29%, NAICS codes 29%, agency 29%, closing date 14%

None of your 83 opportunities carry NAICS codes — that 29% is really being carried by the other signals.

Reach: NAICS codes 0/83 · agency 83/83 · closing date 80/83

Composition and reach — what the lens is worth, and whether the data is there.

- 7 A signal is **skipped** for an opportunity that does not carry that field — never counted against it. So naming a criterion your feed cannot supply does not push opportunities down; it simply does nothing, which is why the reach line is there.

Spotlight buckets — define a lens, then rank the pipeline by it.

Library — build your content atoms

WHERE

/portal/<company>/atoms

Your library is the raw material every draft is built from. You deconstruct your documents into tagged, sized **atoms**, then compose and reuse them. The page has three tabs — **Library**, **Upload package**, **Atomize** — plus a reuse-a-past-proposal panel.

The library — tagged atoms with grain, usage, lineage, and visibility.

Create a canvas · start from a template · downloads

Beyond hand-shredding, you can **create a canvas** — a **foundation artifact** (a whole doc / deck / sheet / PDF) that decomposes on save into reusable section / group / atom grains — and copy in ready-made **starter templates**.

Collaboration vaults (nooks) — a customer-owned, RLS-segregated branch library per external partner — are provisioned server-side (create · invite · upload/atomize · download-whole · ingest, with the isolation contract adversarially proven). The two-sided nook UI ships next.

- 1 Click **Create canvas**. The **Blank** tab mints a foundation from a form (Document · Deck · Sheet · PDF) with a kind × context taxonomy, and opens straight in the canvas editor.

Blank canvas Start from a template

Name

e.g. Capability Statement

Form

Document .docx Deck .pptx Sheet .xlsx PDF .pdf

Kind Context

Document general

Cancel Create

Create canvas — a blank foundation by form + taxonomy.

- 2 The **Start from a template** tab lists the shared starter catalog — capability statement, one-pager, SBIR/STTR technical & cost volumes, DoW CSO brief, commercialization deck. **Use** copies one into your library as your own editable canvas (with lineage back to the original).

Start from a template — the starter catalog, copy-on-use.

- 3 When your library is empty, the **starter offer** appears at the top — **Add all N** bulk-copies the whole starter set in one click (idempotent; addable anytime).

The starter-set offer on an empty library.

- 4 **Browse library** filters foundations / sections / groups / atoms by kind × form × context × vehicle (facet counts update live), and every row offers a native-format **download** (.docx · .pptx · .xlsx · .pdf).

The faceted library browser with per-row downloads.

Browse, filter & compose

- 1 Filter with the search box, the **grain** select (primitive / group / foundational), the status select, and a **My atoms / All atoms** toggle. Click a tag chip to filter by it.

Library Atoms

Shred your own documents by hand — deconstruct into objects, keep only the content you like, tag it against the one taxonomy, and it's sized to drop into section molds. Primitives (a bio, a figure) combine into groups (a Team) with lineage back to their source.

The library filter bar.

- 2 Select atoms with their checkboxes to reveal the **bulk bar**: **Approve all**, **Archive all**, and a tag-dimension + value → **Tag all**.

3 selected → **Approve all** **Archive all** **agency** tag value (e.g. Navy) **Tag all**

The bulk / compose bar appears on selection.

- 3 With two or more selected, name the group (e.g. “Team for Navy”) and **Group into new atom** to compose a reusable bundle.

The screenshot displays the 'Library Atoms' interface. On the left is a dark sidebar with navigation links: Immo Admin, Dashboard, Opportunities, Buckets, Library (selected), Bids, Proposals, Processes, Activity, Team, Documents, Billing, AI Usage, Automation, and Settings. The main content area has a header with the title 'Library Atoms' and a description. Below this is a 'Reuse a past proposal' section. The main list of atoms is shown with columns for search, filters (all grains, any status, All atoms), and a 'Refresh' button. The list contains various atoms with checkboxes, titles, and status indicators. A bulk bar is visible at the bottom of the list, showing '3 selected' and buttons for 'Approve all', 'Archive all', 'agency', 'tag value (e.g. Navy)', and 'Tag all'.

Composing primitives into a group.

Click an atom title to open its **detail drawer** — confirmed vs unconfirmed tags, lineage (↶ derived from / ↷ reused in), and a content preview.

Returned from proposal draft · Technical Volume

Real library atoms — grain, tags, usage, source badges, and lineage.

Atom vocabulary

Facet	Values
Grain	primitive (one block) · group (a bundle) · foundational (a whole reference doc)
Source	uploaded · returned (harvested back from a locked section)
Visibility	private · admin-only · shared
Status	draft · approved · archived

Upload a package (bulk atomize)

The fastest way to fill the library: drop a whole proposal package and let the atomizer shred it.

Verified: five Immobileyes documents atomized into **24 atoms** — tagged `vol:technical` `vol:cost` `vol:key_personnel` `kind:bio` and more.

- 1 On **Upload package**, drop up to 12 files (PDF·DOCX·PPTX·XLSX·TXT·MD) or **Choose files**.

Upload package

The upload-package control.

- 2 Add optional **Package context** (name, agency, program, phase, solicitation, topic) — it's stamped on every atom minted from the package.
- 3 Click **Atomize package**. Each file becomes a **reference atom** plus one **primitive** per substantive block, auto-tagged against the taxonomy.

The real atomizer — 24 tagged atoms from five documents.

Atomize — the hand-shredder

The **Atomize** tab is precision control: paste or upload a document, and box exactly what becomes an atom.

- 1 Paste text (a bio, a past-performance blurb, a whole team section) and **Deconstruct**, or upload a file. The document becomes a list of typed objects (figure / table / list / heading / text).
- 2 Set the **Session context** (the "FROM" pedigree — agency, program, phase, solicitation, topic) so everything minted this session inherits it.
- 3 Select an object, give it a title, add curated + free tags, and **Make atom** (or **Make group** for a table/list). Minted atoms collect in the **Section tray**.
- 4 Select several tray items, name it, and **Box section** to wrap them into a section group.

Reuse a past proposal (templify)

At the top of the page, **Reuse a past proposal** lists your uploaded proposals. **Save as template** extracts a proposal's structure into a reusable skeleton (pick a template type → **Extract structure**); once templated, **New draft** spins up a fresh document from that skeleton. This is how a winning structure becomes the starting point for the next bid.

Capture from screen (box → tag → atomize)

The **Capture** tab pulls content from anywhere on your screen — a Google Doc, a data sheet, a web page — **without connecting an account**. It's the box-and-tag Atomize flow applied to a screenshot.

One-way by design: only the crops you send ever leave your screen — the platform never receives your Google/social credentials and holds no connection back to the source. Captures land as **draft** atoms with a “Screen capture from <host> · <time>” provenance stamp.

Verified end-to-end: a captured frame boxed into two regions produced a reference atom + two tagged region atoms + a section group — all draft, provenance-stamped, insertable into the canvas.

- 1 Click  **Capture from screen** and pick a window, tab, or screen. The frame freezes on the canvas and the screen-share stops immediately — no lingering access.
- 2 **Drag boxes** over the parts worth keeping. Give each region a title and tag it with the same vocabulary as the Atomize tab (   ...); add a source URL + note for provenance.
- 3 Optionally name a **section** to group the regions, then **Atomize N region(s)** → **library**. Each region becomes a **draft image atom** (anchored to a reference of the whole frame), ready to review and insert into a section canvas.

Library Upload package Atomize Capture

Capture from screen — grab a window, tab, or screen (a Google Doc, a data sheet, a web page), box the parts worth keeping, tag them, and they become draft library atoms. **One-way:** only the crops you send leave your screen — no account link, no lingering access.

 **Capture from screen**

The *Capture tab* — grab from any window/tab/screen, one-way in.

Archive an atom (retire it from selection)

Retire an atom you no longer want offered — a stale bio, a superseded past-performance blurb — by **archiving** it. Archiving is soft: the atom stays in indexed storage, it just stops appearing.

Archiving an atom only changes what's *selectable* — it never deletes content and never touches a proposal that already used it. (Foundational documents archive the same way.)

- 1 On an atom, choose **Archive**. It drops out of the library browse *and* out of the draft-selection lists everywhere — it can't be picked into a section until you unarchive it.
 - 2 Atoms are **copied forward** into any proposal that already used them, so archiving one **breaks nothing downstream** — locked and drafted sections keep their copy.
 - 3 **Restore** re-enables the atom for selection at any time.
-

Proposals — your builds

WHERE /portal/<company>/proposals

Every proposal for your company. Proposals aren't created here — they appear when you purchase a topic and an RFP admin releases it.

- 1

Each row shows the title, agency, topic, section count, created date, a due/closed date (red if overdue), and a **stage pill** in the customer V0.5 → V1 labels.
- 2

Click a row to open its build workspace (the compliance matrix).

The proposals list — each row opens its build workspace.

Archive a portal — and restore it

When a build is finished — won, lost, or shelved — **archive the whole portal** to clear it from your active list. Archiving is **soft and reversible**: nothing is ever deleted here.

Nothing is deleted — archived builds stay retrievable. After your retention window they're flagged **cold-storage eligible** (a future sweep bulk-moves them to long-term storage, still pointer-retrievable).

- 1 Open the proposal and click **Archive portal**. Confirm — the portal *and its running workflows* move to the Archived list together (its automations stop; they'll resume if you restore).
- 2 At the bottom of the proposals list, expand **Archived (N)** to see archived builds. Each still opens and still **Exports** (as a .zip package).
- 3 An admin can **Restore** an archived portal back to the active list at any time — its workflows come back with it.

The proposal workspace & compliance matrix

WHERE `/portal/<company>/proposals/<id>`

Opening a proposal gives you the build cockpit: a stage-control bar, the volume/section matrix, team & access, compliance, AI, and export. As an admin you get the full **admin panel** (four tabs).

The proposal workspace — 6-volume matrix, ready to draft and lock.

The stage-control bar

After two proposal locks, further changes require RFP-Pipeline support — the bar says so. Downloads unlock once the proposal is locked/submitted.

- 1 The bar shows **stage progress dots** for each gate (done ✓ / current / future), the due date, and a gate-requirements button (**N requirement(s) pending** or **All gates met** ✓).
- 2 The primary action is **Advance to {next}** → ; at Final you get **Unlock for Edit / Re-lock**. If an advance is blocked, an amber list names the unlocked sections (admins can **Force advance anyway** →).

The admin panel — 4 tabs

The admin panel is your build console.

- 1
- In **Artifacts**, each section row shows a status pill, assignee, a page-fill bar, and **Accept & Lock** (→  **Unlock**). When every section in a volume is locked, the volume reads ✓ **Volume locked** and the **Download** + **PDF** links light up.

A volume group with its lock + download controls.

- 2
- The **export row** — **Download Proposal (.docx)** and **Download all (.zip)** — enables once the proposal is locked.

The proposal export controls.

The live matrix — volumes with per-section Accept & Lock, status pills, and Volume-locked downloads.

Admin-panel tabs

Tab	What you do
Artifacts	volume groups with per-section Accept & Lock , page-fill gauges, Lock Volume , Download (docx) / PDF , Accept & Lock All , and the whole-proposal export row
Team & Access	the TeamManager — invite collaborators, per-section grants, the E/C/V access matrix
Compliance	Run Compliance Check (AI), the compliance checklist, and stage-gate requirements
AI & Library	Draft with AI across empty sections, and Record Outcome (Won/Lost/Withdrawn)

Compliance, team & AI tabs

The other three admin-panel tabs run your review, your people, and your AI.

Invite grants are **per section** and **per permission** (view / comment / edit). A collaborator only ever sees the sections you assign — see the Collaborator guide for the full picture.

AI & Library also hosts **Research this opportunity** — the R&D scout (see 7.5).

- 1 Compliance tab** — **Run Compliance Check** fires an AI pass that scores your proposal against the solicitation's requirements (pass/fail/partial per variable). Below it, the **Compliance Checklist** and the **Stage Gate Requirements** (add a gate with a stage + label, toggle each met).
- 2 Team & Access tab** — the **TeamManager: + Invite** a collaborator (email, name, role, permission, and the sections to assign), then read the **Access Matrix** (sections × people, E/C/V cells).
- 3 AI & Library tab** — **Draft with AI** queues a draft for every empty section; **Record Outcome** (Won/Lost/Withdrawn, once submitted) feeds the result back into your library so winning content ranks higher next time.

Proposal Studio — the guided 3-loop draft

Proposal Studio is the recommended way to draft. It runs your proposal through three gated loops — **Draft** → **Refine** → **Compliance** — and stops at each gate for your review before moving on. Advisory throughout: drafts land in review, and the Studio never locks or submits for you.

Studio is advisory — every draft is redlined and reversible, and no loop ever advances a stage gate, locks, or submits. You stay in control at each gate.

- 1** Click **Start** on the current loop. The agent cohort runs — you can watch it; the gate opens automatically when the loop finishes.
- 2** At the gate, **Preview** the document, then either type comments and **Regenerate** (your comments steer the re-run as guidance), or **Approve** → **next** to advance to the next loop.
- 3** Prefer hands-off? **Run all 3 automatically** chains the loops end-to-end (the same path the admin “doorbell” uses) and still lands in review.

The three loops

Loop	What it does
1 · Draft	Plans from the skeleton + compliance matrix, then drafts every section from your library atoms.
2 · Refine	Reformats + restyles to one house style, runs the cost model, and assembles the package.
3 · Compliance	Checks requirement coverage, section-to-section continuity, and a redaction scan.

AI Actions & the full-draft manager

Below the Studio, the **AI Actions** and **Run full draft** cards give you direct, single-pass AI controls for when you want them.

Every AI output — Studio, Draft, AI Review, or full draft — **lands in review**, redlined and reversible. AI never advances a gate, locks, or submits on its own.

- 1 **Draft with AI** — queues a first draft for every *empty* section.
- 2 **AI Review** — runs an AI **color-team** pass; each section's recommendations post into that section's comment thread for you to accept or ignore.
- 3 **Run full draft** (Advanced) — one full-pass draft across the whole proposal. Pick a **Mode**: **A · HITL + AI** (you drive section-by-section), **B · Restyle** (reformat to one house style), or **C · Full auto** (auto-draft across volumes + a review-gate pass). Optionally set a **Voice** (persuasive / technical / ...). Mode C can add an **Adversarial gate** — a directed 1:n review pass landing as either a **Human review** task or **Auto-reconcile**.

Amendments — a solicitation change to acknowledge

If the agency amends the solicitation after your build started, an RFP admin logs the change and it fans out to your proposal. You'll see an amber **"This solicitation was amended"** banner at the top of the workspace.

Acknowledging records that your team saw the change — it does **not** auto-edit your proposal. Re-check the affected sections and your compliance matrix against the new requirements.

- 1 Read the banner: each change carries a **severity** chip (critical / major / minor / info) and a short summary.
- 2 Click **Show N compliance changes** to expand the exact delta — the added / removed / changed requirements.
- 3 An admin clicks **Acknowledge** to clear the banner for your team. (Contributors see the banner but can't acknowledge — "An admin must acknowledge these changes.")

Research this opportunity (R&D scout)

In the **AI & Library** tab, the **Research Scout** does your R&D — market research, prior art, and the competitor landscape, including DoD sources (SAM.gov, SBIR.gov, DSIP) — and returns a **cited brief**.

Safe by design: every page the scout reads is treated as **untrusted data** (never instructions), the run is **budget/rate-capped** (usage shows in AI Usage), and it **safe-skips** — returning no sources rather than inventing them — if web access is unavailable. Use more, get more.

- 1 Type (or refine) the research question, then click  **Research this opportunity**. The scout runs in the background: it browses the web through a controlled server-side browser, then synthesizes the findings.
- 2 When it finishes, the **cited brief** appears inline — findings with **[source]** links and confidence, plus the competitor list. It's **advisory**: review it and pull the useful bits into your Library / sections; it never changes your proposal by itself.

Research this opportunity

The Research Scout browses the web—including DoD sources (SAM.gov, SBIR.gov, DSIP)—for market research, prior art, and the competitor landscape, then returns a **cited brief for your review**. Web results are treated as untrusted data, and the run counts against your AI budget.

market research, prior art, and the competitor landscape for this opportunity

 Research this opportunity

Research this opportunity — the R&D scout, in the AI & Library tab.

Opportunity origin & compliance

The collapsible **Opportunity origin & compliance** card has three tabs — **Overview** (build stage, lock count, deadlines), **Origin** (frozen-at-purchase: opportunity, agency, program, topic #, solicitation #, bought-from bucket), and **Compliance** (a live "{x}/{y}" mandatory satisfied — "{pct}%" bar and a Satisfied / Partial / Not-addressed / N-A grid). It's your at-a-glance readiness read.

The section canvas — where you write

WHERE `/portal/<company>/proposals/<id>/sections/<sectionId>`

The canvas is the WYSIWYG editor for one section — **what you see is what exports**. Open a section from the matrix. The top bar carries the title, a status pill, export buttons, Undo/Redo, + **From Library**, **Save**, and (admins) **Complete & Lock**.

Argue in figures, not only sentences. A section is a document, so put the picture, the table and the chart where a reviewer expects them. Each is its own block with its own export path: a **table** becomes a real Word table, a **chart** is drawn from your numbers (vector in the PDF, a sharp image in Word), and an uploaded **image** is embedded in the file rather than linked — so the download stands on its own. Give every figure a **caption** block; that is what numbers it “Figure 1”, “Table 1”, “Chart 1” in the finished document.

The canvas editor — toolbar, page canvas, and the toolbox sidebar.

The formatting toolbar & node types

- 1 The **INSERT** group adds a block after the selected one; the **FORMAT** group (B / I / align / size / color) acts on the selected text block.

The canvas formatting toolbar.

- 2 Click any node to edit it in place; drag the handle to reorder. Each node type has its own inline editor.

Canvas node types

Node	Inline editing
Heading	level (H1/H2/H3), numbering, text
Text block	textarea + B / I / U / superscript / subscript mini-toolbar
Bulleted / Numbered list	per-item text, indent/outdent, add/remove item
Image	click-to-upload, alt text, caption, size, replace
Table	editable headers/cells, + Row / + Column, delete
Caption	prefix (Figure/Table/Chart), number, text
Footnote / URL	marker + text / href + display text
TOC	auto-lists the document's headings
Page break / Spacer	structural

The toolbox sidebar

The sidebar opens on **Your toolbox** — a prioritized card list resolved from your role and the stage — then offers tabs.

The Compliance tab — live word-budget gauge, fonts, and content-source dots.

Sidebar tabs

Tab	Purpose
Compliance	document status, a real word-budget gauge (“{words}/{max} words · N-page limit”), fonts/margins, content-source dots (AI / library / manual)
Node / Select	the selected block’s provenance + actions (Move, Accept, Revert, Delete, Replace from Library), a full Format panel, per-node History, Comments, and an AI Revision panel
Add	a 12-button grid of every node type
Review	“Review · Modify · Lock” — admins get Complete & Lock this section ; others save for an admin to lock
History	the version list (AI Draft / Human Edit / Library / ...) — click any to preview
Settings	the floorplan — margins, fonts, line spacing, page/slide limit, header/footer templates

Draft & revise with AI

Verified: the `proposal.draft_section` agent ran on all 8 Technical-Volume sections, grounded in the atomized library, to a ~1,090-word / 2-page target per section. Nothing auto-commits — it’s advisory until you accept.

- 1 Click **Draft** (or **Draft all sections** from the admin panel). The drafting agent reads the RFP context and the section’s mold, pulls the most relevant atoms, and writes canvas content sized to the page budget.
- 2 On a text node, open **AI Revision** for one-click rewrites: **Regenerate** · **Make shorter** · **Make longer** · **More specific** · **Simpler language** · **Stronger opening** · **Add metrics** · **Fix compliance**, or a custom instruction.

Insert & replace from the library

- 1 + From Library opens the insert panel: it ranks your atoms for this section (with “+ N context match(es)”). Tick atoms and **Insert N atom(s) into the canvas** — they become section nodes.

The insert-from-library panel ranks your atoms for this section.

2 The picked atoms flow straight into the canvas as editable nodes.

The screenshot displays the Immobileyes software interface. On the left is a dark sidebar with a menu including Dashboard, Opportunities, Buckets, Library, Builds, **Proposals**, Processes, Activity, Team, Documents, Billing, AI Usage, Automation, and Settings. The main canvas shows a document titled 'TBD - Your Company' with a section header 'GHOST past-performance & partners'. The text in the document describes facilities/equipment and key personnel. On the right is a 'YOUR TOOLBOX' panel with an 'Insert' button and a list of options: Format, Insert from Library, AI Assist, Sections & Budget, Floorplan, Template, Compliance & Status, Export, Review - Modify - Lock, and Harvest to Library. Below this is a 'Compliance Select' section with links for Add, Review, History, and Settings. At the bottom right is a 'DOCUMENT STATUS' section showing Status (empty), Atoms (6), and Version (v2). Below that is a 'COMPLIANCE' section showing Length (644 / 9450 words) and a progress bar. At the bottom right is a 'CONTENT SOURCES' section showing 6 from library.

Atoms inserted into the section canvas.

3 On a selected node, **Replace from Library** swaps its content for a better-matching atom (sortable by best-match / most-used / most-recent).

Drag nodes to reorder them into the flow you want.

The screenshot shows the ImmoAdmin software interface. On the left is a dark sidebar with the 'ImmoAdmin' logo and a list of navigation items: Dashboard, Opportunities, Buckets, Library, Builds, Proposals (highlighted), Processes, Activity, Team, Documents, Billing, AI Usage, Automation, and Settings. The main workspace is a document editor. At the top, there's a 'Related Work' section with buttons for 'Back to Proposal', 'Related Work', 'Export .docx', 'Export .pdf', 'Undo', 'Redo', '+ From Library', and 'Library (6)'. Below this is a rich text editor toolbar with options like 'Insert', 'H Heading', 'Text', 'Bullets', 'List', 'Table', 'Image', 'Caption', 'Format', and 'select all'. The document content is titled 'GHOST past-performance & partners' and contains several paragraphs of text. On the right side, there's a 'YOUR TOOLBOX' section with buttons for 'Insert', 'Format', 'Insert from Library', 'AI Assist', 'Sections & Budget', 'Floorplan', 'Template', 'Compliance & Status', 'Export', 'Review - Modify - Lock', and 'Harvest to Library'. Below the toolbox is a 'DOCUMENT STATUS' section showing 'Status: empty', 'Atoms: 6', and 'Version: v2'. It also includes a 'COMPLIANCE' section with 'Length: 644 / 9450 words' and a 'CONTENT SOURCES' section with '6 from library'.

Reordering nodes on the canvas.

Harvest back to the library

The **Library (N)** button opens the **atomize rail** — each library-eligible node becomes a bubble you can classify (choose a type), tag, and **Accept as atom**, harvesting your best content back into the library for reuse. **Accept all** does the batch.

Accept & Lock

Verified: locking turned **10 matrix rows green** (8 Technical + 2 Cost); Volume 2 read “8/8 locked · 9/10 pages ·
✓ Volume locked.”

- 1 When a section is right, **Complete & Lock** (top bar or the Review tab). Locking flips its compliance row to **satisfied**, snapshots the version, and harvests reusable content back to your library.

★ Review · Modify · Lock
comment, revise, and complete (lock) this ...

The Accept & Lock control.

- 2 Locked sections are read-only; **Unlock** reopens one for edits (admins).

The slide editor

When the artifact is a **slide deck**, the same shell becomes the **SlideEditor**.

- 1 The left **Slides** panel is your thumbnail navigator — each thumb shows the slide title and element count; **+ Add Slide** appends one (you can't delete the last).
- 2 Edit the active slide with the embedded canvas (16:9 or 4:3). The info bar reads “Slide N of M · N element(s).” Export the deck with **Export .pptx** from the top bar.

The spreadsheet editor

A **spreadsheet** artifact (like a Cost Volume) opens the **SheetEditor** — a real grid with formulas.

Verified: the Cost Volume exported to a submission-ready **.xlsx** with live formulas — Base **\$199,502 ≤ \$200k**, Option **\$114,464 ≤ \$115k**.

- 1 Use the **cell-reference box** (e.g. **A1**) and the **formula bar** (**fx**) to enter values and formulas; the format bar handles bold, alignment, fill color, size, and font.
- 2 Add rows/columns with the trailing **+** controls; manage multiple **sheet tabs** at the bottom (double-click to rename). **Export .xlsx** writes the workbook with formulas intact.

The spreadsheet editor — a cost section with live formulas.

Compliance Review — the readiness check

WHERE `/portal/<company>/proposals/<id>/review`

A read-only readiness view across sections and the compliance matrix.

The top banner reads **Ready for Final Submission** (green) or **Not Ready — Items Need Attention** (amber), with a stats bar (Sections Locked · Requirements Met · Est. Pages · Stage). Below, a **Section Status** table (with page estimates and "(over)" flags) and a **Compliance Checklist** (each requirement's status, source, and notes). Use it as your pre-submit gate.

Documents — everything in one place

WHERE /portal/<company>/documents

Every document across the workspace, in five tables: your standalone documents, proposal sections, supporting documents, library uploads, and solicitation source documents.

- 1 + **New Document** starts a standalone canvas document; **Upload Document** sends a file to the library.
- 2 In **Supporting Documents**, use the per-row actions: **Upload** (presigned), **Download**, and admin **Review / Approve / Waive** to advance a required attachment's status.

Proposal Sections

The new-document chooser — blank presets or a template.

Activity & Processes — audit and automation

WHERE `/portal/<company>/activity` · `/processes`

Two monitoring surfaces.

Activity is your audit timeline — namespace tabs (All/Proposal/Library/...), a type search, time ranges, auto-refresh, and expandable event payloads. **Processes** lists your running automations with health chips (Failing/Stalled/Awaiting input/Running/Done); admins can **Move to next gate** on a paused step and expand the **Steps** timeline.

The activity stream — filterable audit timeline.

Processes — your running automations, health-classified.

Team — members & collaborators

WHERE `/portal/<company>/team`

Manage who's in your workspace.

- 1 Invite a member with Email, Name, and Role (**Contributor** / **Admin** / **External Partner**).

The invite control.

- 2 The **Team Members** table lets admins **Deactivate** / **Reactivate** a member (never hard-deleted). **Proposal Collaborators** lists per-proposal partners and their accepted/pending status.

The team page — members, roles, and proposal collaborators.

Collaboration vaults (“nooks”) — segregated partner libraries

WHERE `/portal/<company>/vaults`

A **nook** is a private, per-partner branch library — a segregated clearing house you and one external partner (a subcontractor, a university, a teaming partner) both reach. The partner sees **only** their nook, never your main library or another partner’s nook; your main library and your AI agents never see nook content until you deliberately harvest it. It’s the safe way to exchange content across company lines.

Isolation is enforced end-to-end: nook content carries a `vault_id` that fences it out of every main-library reader *and* every agent, so a partner’s draft can never leak into your library or an AI draft until you harvest it.

Sharing is instruction-based for launch: add only what you’re comfortable with the partner using, and harvest only what you want in your build. Partial-share and signed exchanges are a later addition.

- 1 Open **Vaults** in the sidebar (admins) and **+ New nook** — name the partner and (optionally) their organization. One nook per partner relationship.

The nooks index — one card per partner, with New nook.

- 2 **Invite** the partner by email under **Partner access**. They receive access to *only* this nook and land on their own `/vaults` surface — never inside your portal.
- 3 **Copy content in** (Add artifact) for the partner to use, and **download** anything in the nook at any grain. What you add is a COPY — nothing is linked from your main library.
- 4 When the partner uploads, you get a notification and a **review ToDo**. **Harvest** → **library** pulls a whole artifact into your proposal library (with lineage) so you can use it in a build; until you do, it stays walled off in the nook.

Nook rights — the two sides

Capability	You (owner)	Partner
Invite / remove members · close the nook	✓	—
Copy-in upload & atomize	✓	✓
Download a whole artifact	✓	✓
Download an individual section / atom	✓	—
Harvest a nook artifact into the proposal library	✓	—

Settings — your company profile feeds AI drafting.

Billing & Builds & AI Usage

Billing manages your Spotlight subscription, expert-consulting hours, and purchase history. **Builds** (`/portals`) lists your purchased proposal portals with their lifecycle status (curation_pending shows the 72h SLA countdown; launched/executing offer stage controls). **AI Usage** (`/agents`) shows your agent calls, allocation used, per-agent breakdown, and recent activity.

Billing — subscription, consulting, purchase history.

Builds — your purchased proposal portals.

Export — your submission-ready files

WHERE Download Proposal (.docx) · Cost Volume (.xlsx)

With a volume locked, download your deliverables. The Technical Volume exports to a submission-ready **.docx** (US-Letter, 1" margins, the agency's fonts, figures inline & captioned); the Cost Volume to an **.xlsx** with live formulas.

Whole-proposal packages export as **.json / .docx / .pdf / .zip** from the Artifacts export row (the .zip is per-volume-native). Before you submit, run the **Submission Package** review in the admin panel: it shows a deterministic readiness check and, on demand, queues the **packaging specialist** to compile a manifest — volume completeness, required forms, and page/format compliance — as an advisory report.

Verified deliverables: a **10-page Technical Volume .docx** (6 figures, 5 tables, 8 DON TV2 sections) and a **Cost Volume .xlsx** — Base **\$199,502 ≤ \$200k**, Option **\$114,464 ≤ \$115k**, formulas live.

When it's over, record the result in **AI & Library** → **Record Outcome** (Won / Lost / Withdrawn). Recording **Won** starts a **contract** and drops a **kickoff task** in your queue; every outcome also feeds your library so winning content ranks higher next time.

1.0 Description of Proposed Phase I Technical Effort

This proposal includes data that shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed—in whole or in part—for any purpose other than to evaluate this proposal (SBIR data rights).

Problem and Significance

First-person-view (FPV) fiber-optic drones have become one of the most difficult unmanned-air-system (UAS) threats on the modern battlefield. Unlike conventional FPV systems, these aircraft require no radio-frequency (RF) link, are immune to RF jamming, and operate in GPS-denied environments—relying almost entirely on continuous electro-optical (EO) imagery for terminal guidance. Fielded at scale in Ukraine and by non-state actors, they defeat the RF-centric and GPS-centric counter-UAS (C-UAS) systems the Navy fields today.

Figure 1. Fiber-optic FPV drones—no RF link, immune to jamming—now proliferating in current conflicts.

The operational consequence is stark. RF-based detection and defeat (jammers, spoofers, high-power microwave) have no emission to exploit; GPS denial has no effect on a vehicle flown by wire over fiber; and kinetic interceptors are cost-prohibitive and collaterally constrained against a sub-\$1,000 airframe. A single fiber drone can be produced for a few hundred dollars, yet forces the defender to expend a far costlier effect—an unfavorable cost-exchange and magazine-depth problem that is most acute at the exact moment of a saturating swarm attack against a Naval installation, aircraft on the ramp, or a ship in the littorals.

Existing C-UAS remains optimized for RF disruption or kinetic defeat. Very little work addresses non-kinetic optical defeat of EO-guided fiber drones during the terminal attack—precisely the gap DON26BX03-NP002 targets: a novel, scalable capability to detect, track, identify, and neutralize single and swarm UAS in complex operational environments.

Technical Innovation — GHOST (STORM + DEXTER)

Immobileyes proposes GHOST (Guided Hostile Optical Sensor-hijacking Technology), a software-defined optical counter-UAS architecture integrating two mature Immobileyes/AlphaMicron technologies:

- STORM — AI-enabled EO/IR detection, identification, and tracking with a graduated escalation framework (Warn/Deter → Dazzle/Disrupt → Deny/Damage) and a human-in-the-loop selecting the response level. STORM is detection-agnostic (MOSA): it accepts EO/IR, radar, RF/EW, or TSPI cueing.

Worked example — build a DoD proposal to submission-ready (DoW 2026 SBIR)

WHERE Opportunities → Purchase → the build workspace

This walks a real build end-to-end on a solicitation an RFP admin authored from the uploaded DoW 2026 SBIR BAA (Navy Phase I). When you procure a portal off the opportunity list, your workspace is **provisioned to that solicitation's exact spec** — the six DSIP volumes, the 10-page Technical limit, the 10-point / 1-inch / single-column format floor — nothing to configure.

The provisioned DoW 2026 SBIR build — six DSIP volumes, the 12-section Technical Volume bounded to 10 pages, the Cost Volume, CCR, Supporting Documents, and the Fraud/Waste/Abuse Training volume.

Procure → provision against the spec

You never pick a template or set a page limit — the build inherits the solicitation's bounding parameters. Draft into the sections the RFP admin defined.

- 1 Open the opportunity card and **Purchase** a portal with your comp code — it lands `curation_pending`; an RFP admin releases it **unlocked**, with the compliance matrix pre-loaded from the solicitation.
- 2 Your workspace opens with **every volume and section already defined by the solicitation** — sections numbered in order, each item's icon set by its authored type (a Word narrative, a cost spreadsheet, a form, a PDF), and each Technical section bounded to the 10-page limit.

Draft, lock, and clear the readiness gate

Draft each section (from the library, the Studio, or by hand), then **Accept & Lock** it — locking advances its compliance-matrix row. When every section is locked and the matrix is satisfied, the **submission-readiness** verdict flips to **GO**.

The submitted SBIR build — every section **LOCKED & APPROVED** (1/1 each), the readiness gate cleared, and the header showing 'Locked · Download available'.

Download the compliant package

A locked/submitted proposal downloads as a compliant package — the combined **.docx** and print-fidelity **.pdf**, or a **per-volume-native .zip** (the Technical/CCR/Supporting volumes as **.docx**, the Cost Volume as a native **.xlsx**).

The STTR Direct-to-Phase-II variant

A DoW 2026 STTR Direct-to-Phase-II portal provisions a structurally different build from the same primitive — a **30-page** Technical Volume split into Phase-I Proof of Feasibility and a Phase-II snapshot, a Cost Volume that reflects the **SB≥40% / RI≥30%** work-split, and the SBC ↔ RI Allocation-of-Rights in Supporting Documents.

The STTR D2P2 build — the 30-page Technical Volume (Proof of Feasibility + Phase II snapshot), the Cooperative Work-Split section, and the Allocation-of-Rights in Vol 5.

gowwin — RFP Pipeline Portal · Customer Admin role. Companion guides: RFP-Admin Operations, Collaborator.
