► What changed

Orientation — the admin console

WHERE `/admin · sign in as an rfp_admin / master_admin`

The admin console is where you run the platform: monitor sources, ingest and curate RFPs, release purchases, and oversee every automation and agent. This guide walks the whole surface, screen by screen, in the order you actually use it. Sign in with your RFP-admin credentials; the console opens on the **Dashboard**.

The seeded operator `eric@rfppipeline.com` is a **master_admin** — global access to every tenant plus the full admin surface. `rfp_admin` has the same console; a few master-only screens (System Health, Pipeline AI Controls) are noted where they appear.

The persistent chrome (sidebar, breadcrumb, guards)

Every `/admin/*` page shares three things:

- **Left sidebar** — the navy rail, grouped into **Overview**, **Opportunities**, **Customers**, **Content**, **System**, and **CRM**. The brand link `RFP Admin` returns you to the Dashboard; a `Portal →` footer link jumps to the customer side.
- **Breadcrumb trail** at the top of the content — a click-through history with ‹ Back / › Forward arrows (browser-history semantics, persisted per tab).
- **Unsaved-changes guard** — editors (Site pages, AI-config cards) warn “You have unsaved changes on this page. Leave without saving?” if you navigate away dirty.

A few surfaces are reachable only by link, not the sidebar: `/admin/scouts` (from Sources), `/admin/intake`, `/admin/cards`, and `/admin/opportunities`. This guide covers them all.

The admin sidebar — every surface in this guide is one click from here.

The Dashboard — your daily starting point

WHERE `/admin/dashboard`

The Dashboard is a system-overview landing: metric tiles up top, your ToDo queue in the middle, and live feeds below. It answers “what needs me right now?”

The **ToDo queue** (the `TaskQueue`) auto-reloads every 30s and appears on tenant dashboards too. A **Form** task renders its own required fields; a **Broadcast note** just needs an **Acknowledge**.

- 1 **Scan the eight stat tiles.** Each tile is a click-through that opens its target page in a new tab. **Events Today** also shows a hover preview of the six most recent events.

The eight metric tiles — click any to drill in.

- 2 **Work your ToDo queue** (“Your To-Dos”). Each card carries an urgency chip (**Overdue/Due soon**), a workflow-name pill, and a step trail. The action button is typed to the task — see below.

Your To-Dos 38

The ToDo queue — typed completers per task.

3 Clear a single **ToDo**. A review task shows **Approve / Done** and **Dismiss**; an acknowledgement shows **Acknowledge**; an upload task shows **Open to upload + Mark uploaded**.

A curation *ToDo* with *Approve / Dismiss*.

4 Review the feeds. **Recent Events** (Time · Event · Phase · Actor) and **Pending Actions** (Pending applications · Unclaimed RFPs · Draft atoms awaiting review) — each row deep-links to the right screen.

Recent Events

View all

Recent Events + Pending Actions.

The eight dashboard tiles

Tile	Counts	Opens
Pending Applications	applications awaiting review	/admin/applications
Active Tenants	live companies	/admin/tenants
Library Atoms	approved atoms platform-wide	/admin/analytics
Active Proposals	proposals not submitted/archived	/admin/proposals
RFPs in Curation	solicitations mid-triage	/admin/rfp-curation
Events Today	system_events in 24h (hover = preview)	/admin/events
SBIR Companies	SBIR company records	/admin/analytics
SBIR Awards	SBIR award records	/admin/analytics

The admin Dashboard — stat tiles, ToDos, recent events, pending actions.

The typed ToDo completers

Each ToDo carries the right control for its kind — you never guess how to clear it.

Each card also shows a **WorkflowTrail** — the step breadcrumb with the current step in bold and finished steps struck through, so you see where the work sits.

How each ToDo type is completed

Task type	Control(s)	Result
Acknowledge / Broadcast note	Acknowledge	marks it read
Review	Approve / Done · Dismiss	approves or declines
Upload	Open to upload · Mark uploaded	opens the target, then confirms
Form	typed fields (required marked *) → Submit	captures the form payload

Sources — where opportunities come from

WHERE `/admin/sources` · `/admin/sources/<id>`

Before anything is ingested, you point the platform at where opportunities live. **Sources** is your bookmarked-sites hub; each source can be opened, scouted, and fed documents. This is setup you do once per site and revisit when a site changes.

The screenshot shows the 'RFP Admin' interface with a sidebar on the left containing navigation links like Overview, Command Center, Dashboard, Our Workspace, Opportunities, Intake, RFP Curation, Opportunity Cards, Opportunity Rollup, Sources (highlighted), Scout Monitor, Pipeline Monitor, Templates, Template Stable, Guardrail Defaults, CUSTOMERS, Applications, Tenants, Billing, Waitlist, Purchases, Proposals, Releases & SLA, Expert Time, CONTENT, Site Content, Document Builder, S3 Storage, SYSTEM, Workflows, Process Monitor, Process Ledger, Automation, Automation Framework, System State, System Health, Event Stream, Agents, Analytics, Architecture, CRM, and CRM Console. The main content area is titled 'Sources' and shows a progress bar at the top: Sources (where we look) → Scout Monitor (what we found) → Intake (staged for reading) (16) → RFP Curation (need to approve) (10) → Opportunity Cards (live for tenants). Below this is the 'Opportunity Sources' section, described as 'Bookmark sites for monitoring federal R&D funding opportunities'. It features a '+ New Solicitation' button and a 'Refresh' link. A grid of six source cards is displayed, each with a title, logo, URL, manual status, last crawl time, and actions (Open Site, Upload PDFs, Add Note, Scout Now). The cards are: AFWERX — Air Force SBIR/STTR, DSIP — DoD SBIR/STTR Topics, Defense SBIR/STTR — Preface Downloads, NSF SEED Fund — SBIR/STTR, SAM.gov — Federal Opportunities, and xTech — Army Innovation Competitions. Each card also has a 'Drop PDF files here to upload' zone. Below the grid is a 'Recent Changes' section with a message 'No meaningful changes detected yet.' and a 'Recent Activity' section showing a log entry for 'AFWERX — Air Force SBIR/STTR' with a 'Visit' link.

The Sources hub — one card per monitored site, with recent changes and activity.

Working a source card

Paste Topics opens a modal: paste tab/pipe/comma-separated rows, click **Parse Preview** to see a table, then **Import N Topics**. It auto-detects the delimiter.

- 1 Click **+ New Solicitation** (top-right) to jump straight to the RFP upload form, or work an existing card below.
- 2 On any card, the five actions are: **Open Site** (logs a visit, opens the site), **Paste Topics** (opens the paste-and-parse modal), **Upload PDFs** (drops files straight into ingest), **Add Note** (inline admin note), and **Scout Now** (runs the scraper immediately).
- 3 Drag files onto the card's "Drop PDF files here to upload" zone to ingest without clicking.

Source detail — crawl schedule & monitored regions

Click a source name to open its detail page.

- 1 Toggle **Auto-crawl** on, then pick a **Schedule** (Daily 6am UTC, Every 12 hours, Weekly, Every 6 hours, or a **Custom** cron). **Scout Now** runs it on demand.
- 2 Edit **Admin Notes** and **Visit Instructions** inline (Edit → Save).
- 3 Add a **Monitored Region** (Name, Region Type, Content Context, optional selector/sample) so the scout watches a specific part of the page and flags meaningful diffs.
- 4 Review **Change History** — each diff carries a severity pill and a **Review** button that marks it seen.

404 This page could not be found.

Source detail — crawl settings, monitored regions, change history.

Scout Monitor — the worker pool

WHERE /admin/scouts

The scout pool is the fleet of workers that visit your sources on schedule, diff them, and surface new or changed solicitations. This screen is a pure monitor — setup and “Scout Now” live on the Sources page.

Scouts run **managed and audited** — a run that fails on one source continues on the others; nothing dead-ends. Kick a run from **Sources** → **Scout Now**.

- 1 Read the **five metric cards**: Active sources · Healthy · Degraded/error · Running scouts · Changes (24h).
- 2 Scan the **Worker Pool** table (Source · Agency · Health · Fails · Last success · Avg run · Last visit). Health is **healthy/degraded/error/unknown**; a red Fails count needs attention.
- 3 Check **Recent scout runs** and **Changes detected** to confirm the pool is finding new opportunities.

Intake — stage an opportunity by hand

WHERE

/admin/intake

When you find an opportunity yourself, **Intake** stages it into the review queue at status **new** (not yet live) — the manual stand-in for scout discovery.

- 1 Fill **Title** and **Agency** (both required), plus any of Office · Unit · Solicitation # · Program (SBIR/STTR/BAA/OTA/CSO) · Initial stage (Pre-Release / NOFO) · dates · POC.
- 2 Add a **Source URL**, **Description / notes**, and internal **RFP Expert Notes** (carried on the card). Tick **Docs were downloadable** if applicable.
- 3 Click **Stage into review queue**. On success the form clears and shows **Staged ✓ Curate it** → linking straight to RFP Curation.

Stage into review queue

The Intake form — stage a found opportunity into the triage queue.

RFP Curation — the ingest → curate → push cockpit

WHERE `/admin/rfp-curation` · `/upload` · `/<solId>`

Curation is the heart of the operator's job. You claim a solicitation, extract its topics, attach compliance, build the volume/section skeleton, and finish with **Push** — the fan-out that puts the opportunity in every tenant's pipeline. This is a multi-part workspace; take it in order.

When Ingest Assist says a value is “Set elsewhere”, that is a job for you, not an error. A solicitation that defers its page limit or submission format to the Component-specific instructions leaves that field genuinely unknown — and the product will not invent one, because a value it did not read must never look like one it did. **Push** then holds the opportunity until a person supplies it. Open the referenced instructions, enter the value yourself, and it is recorded as **your** entry (`hitl` provenance) with a note of where it came from — never laundered into looking machine-read.

Why a master with everything filled in can still read “below the bar”. Build-out readiness checks five things, not three: compliance authored, ≥ 1 volume, ≥ 1 required item, **no undecided items**, and **no undecided volumes**. The last two matter more than they look — an item nobody has ruled on still provisions as a writable section, and the drafter will fill it with plausible prose, which is how a build ends up with an AI-written “Reps & Certifications” where a signed federal form belongs. Either attach a mold or mark it completed elsewhere; the bar is asking you to decide, not reporting a fault.

The triage queue — claim, filter, and open solicitations for curation.

The triage queue

- 1 Use the **Filter** select to narrow by status (each option shows its count); **Refresh** re-pulls.
- 2 Each row shows Title · Source · Agency · **Status** · Namespace · Ingested. Click a row to open the workspace.
- 3 Per-row actions depend on status: a **new** row offers **Claim**; a row you've claimed offers **Release for AI** and **Dismiss**; an analyzed row offers **Open**. A stale claim (>24h) shows a **stale** pill, and a master_admin can **Force Release** it.

A triage row with its status pill and actions.

Solicitation status values

Status	Meaning
new	just staged / discovered, unclaimed
claimed	an admin owns it
released_for_analysis	handed to the AI shredder
ai_analyzed	shredder done, ready to curate
curation_in_progress	being curated
review_requested	sent for a second look
approved	curation approved — ready to Push
pushed_to_pipeline	fanned out to tenant cards
dismissed / rejected_review	stopped, with a reason

Upload an RFP

Bring a solicitation in by hand from + **Upload RFP**.

A duplicate file is caught (**DUPLICATE_FILE**) and offers a **Go to the existing solicitation** → link instead of making a second copy. Malformed PDFs are sanitized on ingest.

- 1 Fill the **Solicitation Metadata** (Title + Agency required; Program Office, Program Type, numbers, dates). Filenames auto-fill empty fields.
- 2 Drag documents into the **Documents** zone (PDF/DOCX/XLSX/PPTX/TXT, max 30 MB total). Pick the **primary** with the radio; others become attachments.
- 3 **Multi-topic BAA?** Drop the individual topic files into the **Topic files** zone on the same form — each becomes a topic opportunity under this solicitation in one submit (the button shows **Upload + N topics**). Leave it empty for a single-topic solicitation, or add topic files later from the workspace drop-zone.
- 4 Leave ✨ **Run Ingest Assist after upload** ticked — it parses the docs, auto-builds the compliance matrix, volumes and section molds, and publishes the card(s). Click **Upload & Ingest Assist**.

The curation workspace

Opening a solicitation gives you the full cockpit. Work top-to-bottom.

Each matrix field carries a source pill — **Verified** (green, you confirmed it) or **AI** (yellow, suggested). Click **p.N** on a field to jump the PDF viewer to where it was found.

One solicitation + N topic files → N opportunities. Upload the umbrella solicitation, then drop its topic files into the drop-zone — each becomes a topic opportunity under the umbrella (deduped, text-extracted, linked to its file). **Push** then fans the umbrella + every topic to all tenants, so 20 topic files land 21 cards.

Push names everything at once. If a decision is missing, `solicitation.push` refuses with the full list — “cannot push: 2 item(s) in the minimum release set are undecided — highlighted passages ...; award size ...”. A 66-topic BAA does not make you discover them one attempt at a time.

- 1 **Write the Spotlight-match summary** (top). It is **required before Push** — an empty summary blocks the fan-out. Save it; the banner turns from rose to green. The **Expert note** beneath it is customer-visible: it rides every tenant’s card and is the first thing they read on the solicitation page, above the marked passages.
- 2 **Decide the minimum release set**, in the same panel. Release is the moment an opportunity stops being ours and becomes a customer’s basis for spending money, so four things must be DECIDED before it can go: the summary, the **award size**, the **source documents**, and the **highlighted passages**. Each is satisfiable by recording an absence — what Push will not accept is silence.

The screenshot shows a form titled "Spotlight-match summary" with a red asterisk. Below the title is a descriptive text: "First-pass matching context (from the shred recommendations) — this is what ranks against customer spotlight buckets. Editable after release too: a save re-fans every tenant's mirror card." The form contains several sections: 1. A text area for the summary with the text: "Annual DoW SBIR BAA covering all participating components. Phase I feasibility awards to \$250k over 6 months; component-specific instructions govern evaluation, and the Critical Technology Areas list defines eligible topics. Direct-to-Phase-II available where prior feasibility can be demonstrated." 2. An "Expert note" section with a yellow "Customer-visible" tag and a "Shown on every tenant's card" note. It contains the text: "Umbrella BAA — component instructions are the operative rules. Navy and AF sections carry different evaluation weightings." 3. An "Award size" section with a yellow "Customer-visible" tag and a "Required before release — an estimate counts" note. It includes a dropdown menu set to "Admin estimated amount", a text input field containing "\$ 250000", and a note "Shown to customers as 'our estimate'". 4. Two dropdown menus at the bottom: "Source documents" set to "Attached to this solicitation" and "Highlighted passages" set to "Marked in the document". At the bottom left are "Save" and "Saved" buttons.

Summary, expert note, award size and the two release decisions.

- 3 **Award size** has three settings, and the middle one is why it is not just a number. **Stated in the solicitation** renders as “\$250,000”. **Admin estimated amount** renders as “\$250,000 · our estimate” — use it when you know what a Phase I runs and the topic is silent; the customer sees that it is our judgement, not something we read. **Solicitation does not state one** renders as “Award size not stated”, which is a finding, not a blank.
- 4 **Source documents** and **Highlighted passages** are the same shape: attached / the organization published none, and marked / none needed for this instrument. An umbrella BAA whose governing text lives in the component instructions genuinely needs no highlights — say so, and Push is satisfied.

- 5 Use the **quick-nav tabs** — Documents · Topics · Compliance · Customer Interest — to jump around.

The workspace quick-nav tabs.

- 6 **Tag compliance variables on the PDF.** Select text in the viewer to open *Tag as Compliance Variable*, pick or add a variable, and save its value — provenance (doc + page) is recorded.
- 7 **Extract & manage Topics.** For a multi-topic BAA, **drop the individual topic files** into the topic drop-zone — **each file becomes its own topic opportunity** under this umbrella (text extracted, deduped, linked back to its file). Or **Extract Topics** (scan the umbrella text), **Import all topics from source**, **Bulk Import**, or **+ Add Topic**. Then **Manage Compliance** to set per-topic overrides (phase-grouped, with presets).
- 8 **Build Response Volumes.** **+ Add Volume**, then per volume **+ Add required item** — each item points at a **starter template (mold)** and carries its format rules (page limit, font, margins).
- 9 **Advance the state machine.** The action bar shows only the valid next steps: **Claim** → **Release** → **Start Curation** → **Request Review** → **Approve** → **Push**. **Push** is the fan-out.

Spotlight-match summary * Required before release into the Opportunity Pipeline

First-pass matching context (from the shred recommendations) — this is what ranks against customer spotlight buckets. The full skeleton is a separate, later step.

NAVAIR/NAVSEA Counter-UAS Open Topic (CSO). Phase I: 6-mo base ≤ \$200K + 6-mo option ≤ \$115K. 10-page white paper, CMMC L2, ITAR. Fits AI sensor-fusion / C-UAS detect-track-defeat.

The curation workspace — documents, PDF tagging, topics, volumes, compliance matrix.

The curation modals

Curation uses a family of modals; here is what each one captures.

Ingest Assist (✨) can build the topics, volumes, items and compliance in one pass — you then refine. It warns before replacing existing structure.

Curation workspace modals

Modal	Opened by	Key fields
Add Topic	+ Add Topic	Topic Number · Status · Title · Description · Branch · Tech Focus Areas
Bulk Import Topics	Bulk Import	Default branch · a topics textarea (auto-detects delimiter, live preview)
Topic files → opportunities	topic drop-zone	drag/drop N topic files · each becomes a topic opportunity (text extracted, deduped, file-linked)
Add Volume	+ Add Volume	# · Format · Volume Name · Description · Special Requirements · Applies to Phase
Add/Edit Required Item	+ Add required item	# · Type · Name · Required · limits/format · Starter template (mold) · Expert notes
Tag as Compliance Variable	select text in the PDF	variable name · category · value (with memory suggestions)

Customer interest & topic detail

At the bottom of the workspace, **Customer Interest** lists tenants who rated topics under this solicitation — with the topic, the date they rated it, whether they bought a portal, the proposal stage, and a **View Portal** link (which drops you into that tenant's workspace). Open a single topic (from the Topics list) to edit its Title, Description, Status, and Tech Focus Areas on the **topic detail** page.

This panel is per-solicitation. The cross-cutting view is the **Demand** column on Opportunity Cards, which ranks every opportunity by how many customers rated it and how many went on to read it — the queue for deciding what to build out next.

Assess ingest readiness (advisory)

Assess ingest readiness wakes the **RFP Ingest Manager** agent to look over a curated solicitation and recommend what to do next. It is advisory and read-only — it never edits the solicitation and never descends into a tenant.

This is the platform-side analog of the tenant **Proposal Studio** manager: it *plans*, it doesn't act. Use its readout to decide whether to run **Ingest Assist** or hand-finish the curation.

- 1 Click **Assess ingest readiness**. You get an immediate, deterministic **stage snapshot** — shred → extract → matrix → skeleton — showing how far ingest has progressed.
- 2 In the background the manager posts a coordination plan (which specialist agents to run next) to the **Agent Workforce** audit; the run is injection-fenced and budget-capped like every agent.

Amendments — log a change, fan it out to tenants

When an agency amends a solicitation after it's been built against, the **Amendments** panel is how you push the change to every affected proposal. Log it → confirm it → each tenant acknowledges.

Confirming is a customer-visible action — it raises a banner on every affected build. Log the delta precisely (it's what the tenant sees); dismiss anything that isn't a real compliance change.

- 1 Click + **Log amendment**. Give it a **label** (e.g. "Amendment 0002"), a **severity** (critical / major / minor / info), a **summary**, and — row by row — the **compliance delta** (added / removed / changed requirement + detail).
 - 2 Review the logged amendment, then **Confirm** → **notify**. This fans the change out to *every active proposal* built from this solicitation (archived builds are skipped); each tenant gets a banner to acknowledge.
 - 3 Watch the per-amendment **acknowledged N / M** counter as tenants clear their banners. **Dismiss** a false positive instead of confirming — no fan-out.
-

Opportunity Cards — the fan-out cockpit

WHERE

/admin/cards

After a push, **Opportunity Cards** is the master view of every opportunity and how it fanned out: curation status, matrix summary, bridge version, and — the column that decides what you build next — **Demand**: who rated it, who went as far as reading it, and who bought. It is also the one place with a lifecycle stage control.

The related **Opportunity Rollup** (/admin/opportunities) is a read-only cross-tenant view: per opportunity, how many tenants ranked vs pinned it and each proposal's build stage.

- 1 Use the **filter box** to find by title/agency/number/topic. The table auto-refreshes every 30s; the summary reads “N shown · N total · N on bridge · N replicated”.
- 2 Sort by any column header (Opportunity · Curation · Matrix · Bridge · **Demand** · Stage · Ingested · Close). Sorting by Demand is the point of the column — it puts the opportunities customers asked for at the top, where sorting by replication could not, since every card fans out to every tenant.
- 3 Read the **Demand** cell as three facts: 7 tenants · 👍 2 · 👎 1, then 0 opened the documents, then the flag. The middle line is the one worth having — the gap between saying yes and pulling the documents is where interest dies.

Not to exceed	uncurated	no matrix	v10 · updated	7 tenants · 👍 2 · 👎 1	Open	Aug 30, 2026	Aug 31, 2026	Oct 14,
Department of War · SOCOM · sbir_phase_1 · S...				0 opened the documents	interest · no build-out	move →		

The Demand column — ratings, the read-through, and the build-out case.

- 4 An amber **interest · no build-out** flag means tenants have rated this opportunity 👍 and nobody has bought it, and the master has no build-out. That is the specific, actionable case for authoring the volumes and molds: it is the work that turns interest into a purchase. The flag is deliberately narrow — it does not appear on a card simply because the row exists.
- 5 Change lifecycle with the “**move →**” **select** in the Stage column — it offers only the allowed transitions (nofo → pre_release → open → updated → closed → archived) and records the change.

The screenshot displays a dense table of project data. The table is organized into several columns, including project names, dates, status indicators (represented by colored icons like green, yellow, and red), and numerical values. The data is presented in a clean, professional layout with a light blue header and alternating row colors for readability. The table appears to be a comprehensive overview of various opportunities or projects, with each row representing a specific entry.

Master opportunity cards — curation, matrix, bridge version, demand, and the stage control.

Purchases — release a bought portal

WHERE `/admin/purchases` · `/admin/applications`

When a customer buys a proposal portal with a comp code, it lands here as `curation_pending` with a **72-hour SLA**. You release it from the shadow account — releasing provisions the build **unlocked** and instantiates the compliance matrix and molds from the master solicitation.

You can also grant a build **free** — approve it as a **comped portal** instead of waiting on a purchase. That records a **\$0 purchase** row (`metadata.grant=admin`) and emits the same `capture:purchase.completed` event, so a comp **audits exactly like a paid buy**. (Self-serve Stripe checkout is descope'd for V1 — the comp code `rfppipelinetest` and this admin grant are the two paths in.)

- 1 Find the `curation_pending` purchase (watch the 72h clock).
- 2 Open the tenant's build and **Release to customer** — this provisions the matrix + molds and unlocks the build.

Comp codes

A one-time code opens a proposal portal without a card. Hand one to a buyer; the first redemption burns it.

The purchases queue — comp-code and Stripe buys, with the release action.

Applications — onboard a founding-cohort company

WHERE `/admin/applications`

Founding-cohort applications arrive here. Accepting one provisions a tenant and emails credentials; the row auto-enriches with the applicant's SBIR award history.

An already-decided application gets a **Change Status** block (new status + an audit note ≥ 5 chars). Every status change is audited.

- 1 Expand a row. It auto-fetches **SBIR/STTR Award History** (awards, funding, agencies) and shows Contact, Company, Federal Readiness (SAM/CAGE/UEI), Technology, and target programs/agencies.
- 2 Write **Admin Review Notes** (min 10 chars), then **Accept** or **Reject**.
- 3 On **Accept**, a green panel returns the new workspace path plus **Login Credentials** (email + temporary password) and the welcome-email status. Re-accepting never re-creates the tenant or re-sends email.

Ada Admin admin@acme-navy.test 7/16/2026

An application expanded — readiness detail before you decide.

Applications — expand a row to review readiness and accept/reject.

Templates — the section-mold studio

WHERE `/admin/templates` · `/admin/templates/<id>/edit`

Templates are the section **molds** a required item points at — the format contract (page limit, margins, font, structure) every provisioned proposal inherits. Author them here, or templify a winning past proposal.

System templates carry an indigo **System** pill and open read-only — use “Save as new” to fork one. Editing saves the canvas back to the mold.

- 1 Click **+ New Template**, name it, pick a **Type** (Technical Volume, Cost Volume, Slide Deck, ...) and a **Canvas** (Letter/DOCX, Slides/PPTX, Spreadsheet), then **Create & open editor**.

The New Template panel.

- 2 Filter the library by Type / Agency / Program; **Clear filters** resets.

A template card with node count + limits.

- 3 **Preview** a system template (read-only, with its merge-field chips), or **Edit** a custom one to open the full canvas editor. **Delete** removes a custom mold (items fall back to the registry).

Workflow Monitor — see & control every automation

WHERE

/admin/workflows

Every automation runs as a **managed workflow** — no fire-and-forget. This is the canonical control surface: launch forms, the template catalog with activation, and the live/recent instance monitor with advance, retry, and cancel.

A step that fails continues on independent branches; a human gate parks and resumes. The same runs also appear under the legacy **Process Monitor** and **Process Ledger** — treat **Workflows** as primary.

The Workflow Monitor — stats, catalog, active instances, and recent history.

Launching a workflow

- 1 **Generate Content** — Title, Content type, Brief, optional Slug → the CMS pipeline drafts it and parks at a review ToDo within ~10s.
- 2 **Launch Review Gate** — a human-in-the-loop gate: pick Scope, Assign-to role, Due hours, and the entity keys (Opportunity ID is the spine key). It parks a task on the assignee.

The screenshot shows a web interface for a workflow management system. At the top, a breadcrumb trail reads: Sources / 02a27d70... > Scouts > Intake > RFP Curation > RFP Curation / 0fdf2ada... > Opportunities > Cards > Purchases > Applications > Templates > Workflows. The main heading is 'Workflow Monitor' with a subtitle 'Workflow tracking and management'. To the right are links for 'Process Monitor' and 'Back to Dashboard'. The section is titled 'Generate Content' with a description: 'CMS content vertical — AI drafts the body, then it parks at a review ToDo for approval before publishing.' The form includes a text input field with the placeholder 'SBIR Phase I matters', a 'Content type' dropdown menu currently set to 'blog post', and a large text area with the placeholder 'What should the article cover? e.g. Explain SBIR Phase I eligibility and the application timeline to a first-time small-business applicant.' A small '6' icon is visible in the bottom right corner of the text area.

The two launch forms — Generate Content + Launch Review Gate.

The catalog + activation

- 1 Open **Workflow Catalog** to see every template with a status dot, description, trigger key, and instance counts (running/paused/done/failed).
- 2 Toggle **Activate / Deactivate** per template. Deactivating refuses new launches (existing instances finish) and is audited.

The catalog with per-template activation.

Monitoring & driving instances

- 1

The **stats bar** shows Running / Paused / Completed 24h / Failed 24h. **Active Workflows** auto-refreshes every 10s with a live elapsed timer.
- 2

Click **Steps** to expand the transition timeline (step · from → to · actor · time · reason).
- 3

Advance a **paused** instance (HITL override), **Cancel** a running one, or **Retry** a failed one from Recent History. A failed row's **error** toggle shows the failing step + message.

A live instance with its progress bar and controls.

Completed/failed history: 24h7 days30 days90 days180 days1 year

1● Paused 1● Completed 24h 0● Failed 24h 0

The live stats bar + active instances.

Workflow instance states

State	Meaning
running	executing now
paused	parked on a human gate — Advance to continue
completed	finished
failed	errored — Retry re-runs it
cancelled	stopped by an admin
retrying	re-running after a failure

Automation Rules — event → action

WHERE `/admin/automation`

Automation rules fire actions on system events. Each rule watches a `namespace:type` trigger and runs an action (notify, queue a job, send email, create a ToDo, publish content, ...).

Action types include `queue_notification`, `send_email`, `create_todo`, `distribute_social`, `publish_content`, `webhook`, and more — each rendered as a colored pill.

1 Read the four cards: Total Rules · Active · Inactive · Executions (24h).

2 In the table, flip a rule's **Active** toggle to enable/disable it (optimistic, audited).

Purchase needs curation

Alert the RFP admin when a customer purchase...

`capture:purchase.completed`

View
Config

View
Logs

An automation rule row with its toggle.

3 View Config expands the action's JSON; View Logs jumps to the event stream filtered to that trigger.

Automation rules — triggers, action types, and per-rule toggles.

Agents — the AI workforce & its budget

WHERE /admin/agents · /admin/guardrail-defaults

The **Agents** screen is the workforce roster and its usage. Tenant-space agents are **tenant-bound** and **advisory** — they propose, a guardrail checks, and a human accepts; they never auto-write business tables.

Research Scout (status **live**): a tenant-bound R&D agent a customer triggers from a proposal's **AI & Library** tab (“Research this opportunity”). It browses the web — including DoD sources (SAM.gov, SBIR.gov, DSIP) — through a controlled, SSRF-guarded server-side browser and returns a cited brief. Same safety contract as every agent here: **web results injection-fenced** (data, never instructions), **budget/rate/cost-capped** via Pipeline AI Controls, and **human-gated** (advisory brief, never auto-written). Usage shows in this roster and the tool-invocation audit — the “use more, pay more” model applies.

1 Read the **roster**, grouped into four pods (Tenant build & pursue · Master ingestion · Our-org RFP-admin ops · Our-org CMS). Each agent shows scope (🔒 Tenant-bound), what it wakes on, status (live/wired/dormant), 30-day queue, and last run.

olume.delete_required_item	Delete a required item from a volume.	rfp_admin	No

cent Tool Invocations

vent	Phase	Actor	Duration	Status	Time
ivoke.start	end	eric@rfppipeline.com	27ms	OK	7/20/26, 7:16 PM

The tool registry + recent invocations — the agent audit trail.

Guardrail defaults

`/admin/guardrail-defaults` sets the hard limits every customer portal launches inside.

- 1 Set **Max stages**, **Max collaborators**, **Max managers**, and **Max nudges**, then **Save limits**. Changes apply to future launches; frozen configs are unaffected.

The screenshot shows the 'Guardrail Defaults' configuration page. On the left is a dark sidebar with a menu. The main content area has a title 'Guardrail Defaults' and a subtitle 'The hard limits + defaults that bound every customer portal at launch. Changes apply to future launches; frozen configs are unaffected.' Below this are four input fields: 'Max stages' (value 3), 'Max collaborators' (value 25), 'Max managers' (value 25), and 'Max nudges' (value 3). A blue 'Save limits' button is below these fields. At the bottom, there is a section 'Default stages + nudge schedule (JSON):' with a text area containing a JSON configuration.

Portal v.4

Guardrail Defaults

The hard limits + defaults that bound every customer portal at launch. Changes apply to future launches; frozen configs are unaffected.

Max stages: Max collaborators:

Max managers: Max nudges:

Save limits

Default stages + nudge schedule (JSON):

```
{
  "stages": [
    {
      "key": "draft",
      "label": "Draft"
    },
    {
      "key": "review",
      "label": "Review"
    },
    {
      "key": "final",
      "label": "Final"
    }
  ],
  "nudgeDays": [
    2,
    5,
    9
  ],
  "codeTypes": [
    "acknowledge",
    "complete_sections",
    "upload_documents"
  ]
}
```

Guardrail defaults — the safety envelope for new launches.

Proposal Auto-Drive (the doorbell)

From `/admin/agents` you can drive a tenant's **full draft** from up top — the “doorbell.” It fires the exact same engine the customer's **Proposal Studio** uses, without you descending into the portal.

Advisory, like everything here: the auto-drive drafts across the proposal and lands in review — it never advances a stage gate, locks, or submits. The tenant sees the drafts arrive in their workspace, fully attributed.

- 1 On the **Proposal Auto-Drive** card, pick the target proposal and ring the doorbell — it posts a full-draft request (Mode C, full-auto) for that build.
- 2 The request funnels through the one shared helper as the in-portal button, so it lands as a single auditable record; the only difference is **source = admin_doorbell** vs **portal**.

Observability — Events, Process Monitor, Ledger

WHERE

/admin/events · /admin/process · /admin/processes

Three complementary lenses on “what happened, when, and did it finish?” across every tenant.

Event Stream

- 1

Filter by **Namespace** (finder/capture/identity/proposal/library/system/tool), a **time** window (1h/6h/24h/7d), and toggle **Auto-refresh** (10s).
- 2

Each row shows Time · Event · **Phase** (start/end/single/error) · Actor · Tenant · Payload (click to expand).
- 59s ago

The event stream — filter by namespace, type, and time window.

Process Monitor

A real-time view built from events: **namespace stat cards**, an **In Progress** list (started-without-end), **Recent Completions**, a collapsible **Errors** panel (auto-expands when non-zero), and a **Tenant Activity (24h)** table.

The process monitor — in-progress, completions, errors, tenant activity.

Process Ledger

The cross-tenant list of active `process_instances` , health-classified so problems surface first. Filter by **health** chips (Failing/Stalled/Awaiting/Running) or by tenant, and **Advance** a paused gate inline.

The process ledger — active instances, health-classified, advanceable inline.

System State — the operational dashboard

WHERE /admin/system-state

A tabbed operational board that auto-refreshes every 30s. The always-on **HealthBar** (Active Workflows · Pending Jobs · Events 1h/24h · Automation Rules · Errors 1h) sits above eight tabs.

- 1 Start on **Overview** (top workflows, pipeline, recent errors, event volume).
- 2 Drill into **Active Workflows** (expandable cards with per-step status), **Pipeline** (sources · curation queue · proposals by stage), **Content Pipeline**, and **Email Automation**.
- 3 Use **Process Trees** (recursive event trees), **Errors**, and **Event Volume** (stacked hourly chart) to diagnose.

The eight System-State tabs

Tab	What it shows
Overview	top active workflows, pipeline, recent errors, event-volume chart
Active Workflows	every running instance as an expandable card with per-step status + JSON
Pipeline	ingestion sources · curation queue by status · proposals by stage
Content Pipeline	published/draft blocks, pending reviews, content event timeline
Email Automation	rules fired, emails sent/pending, failures, execution log
Process Trees	recursive event trees (expand/collapse all)
Errors	the full recent-errors table
Event Volume	stacked hourly bar chart by namespace

System State — HealthBar + eight tabs (Overview, Workflows, Pipeline, Content, Email, Trees, Errors, Volume).

System Health · Analytics · Storage

System Health (/admin/system , master_admin only) is the capacity view — queue depth, tool-invocation latencies (p50/p95), registered tools, recent errors. **Analytics** (/admin/analytics) rolls up tenants, proposals, atoms, revenue, and visitor traffic. **Storage** (/admin/storage) is the S3/R2 file manager (Curation Files · Pipeline Artifacts · Customer Storage · Reference Library) with presigned uploads, folders, rename, and bulk actions.

Analytics — platform + visitor-traffic rollups.

Storage — the S3/R2 file manager.

Tenants — oversight & shadow-descend

WHERE `/admin/tenants` · `/admin/tenants/<id>`

Tenants is the roster of every company. From a tenant you review its state, tune its AI budget, archive/restore access, and — the operator's superpower — **shadow-descend** into its portal to do work on its behalf, then rise back to ingest more.

One account, both jobs. `eric@rfppipeline.com` ingests at `/admin`, descends into Immobileyes to build, then rises back up — no separate login.

Archive = license slumber (reversible). Archiving a company sets its archived-at watermark; every non-admin user loses access at once (the access gate reads that watermark) and its running workflows cascade to archived — *without* touching anyone's individual membership. **Restore** lifts the gate and returns everyone to *exactly* their prior state (active users active, individually-inactive users still inactive). Nothing is deleted.

- 1 Create a company with **+ New Company** (name + admin POC email → returns the slug and a temporary password).
- 2 Open a tenant to see its users, recent activity, and company details.

A tenant detail page — users, activity, AI budget, archive control.

- 3 Set an **AI Budget & Limits** override (monthly budget, rate limit, per-call ceiling) or **Archive / Restore** access when a license lapses.

8, 2026

/portal/immobileyeyes/dashboard

Budget & Limits

Blank to inherit the pipeline default. Set the monthly budget to 0 to disable AI for this account.

Monthly budget (\$)

default 50.00

inheriting default (\$50.00/mo)

Rate limit (calls / hour)

default 50

inheriting default (50/hr)

Call ceiling (\$)

default 0.50

inheriting default (\$0.50)

The tenant roster — users, atoms, proposals per company; + New Company.

Billing & Waitlist

WHERE /admin/billing · /admin/waitlist

Two lightweight customer screens.

Billing summarizes revenue, recent purchases (with status pills), and per-tenant subscription status. **Waitlist** is a read-only list of marketing-page email captures with a **View Applications** link.

Billing — revenue, recent purchases, subscription status.

Waitlist — marketing-site email captures.

Site Content — the dynamic-content editor

WHERE `/admin/site`

The public marketing site is edited here as **versioned blocks**: every save is a snapshot, and publishing swaps the live version the public site reads. This is the same “dynamic content section” model these very manuals use — edit data, publish, done.

- 1 Pick a **Page** (or the Header & Footer, or a **Document**). Each row shows its live version and draft state.

A site page row with its version + state.

- 2 Edit the **blocks** — section name, Title, Body, Excerpt, image (with upload), icon, and metadata JSON. **+ Add block** appends one.

- 3 Add an **audit note**, then **Preview** (iframe of the public path), **Save draft**, or **Publish** (makes it live).

Site Content — pages, site chrome, and documents, each version-controlled.

Document Builder

Document Builder (`/admin/documents`) authors standalone canvas documents (templates, examples, reference). **New Document** picks a format preset; the editor is the full canvas with save, multi-format **Export** (docx/pptx/xlsx), and version **History** (restore any prior save).

Worked example — author a real DoD solicitation (DoW 2026 SBIR & STTR)

WHERE /admin/rfp-curation/<solId>

This ties the curation cockpit (§6) together on two **real** solicitations, ingested from the uploaded DoW 2026 BAAs (Department of War — the renamed DoD). Each solicitation is unique — you build **its own** compliance matrix, volume definitions and document templates from the BAA text, then **Push**. The two below are structurally different documents produced from one canvas primitive.

The DoW 2026 SBIR (Navy Phase I) curation workspace — the authored Compliance Matrix (Technical 10pp, Times New Roman 11pt, 1-inch margins, DSIP single-column) and all six DSIP Response Volumes.

Build the compliance matrix from the BAA

Read the real requirements off the BAA and set them in the **Compliance Matrix** rail — these are the bounding parameters every volume inherits and the export gate enforces.

Compliance is built **per solicitation at ingest**, never from a generic preset. A preset is only a cold-start scaffold — the canvas can bound any document to any solicitation's parameters.

- 1** **Page limit is component-specific.** The DoW 2026 SBIR BAA sets the Technical Volume limit per Service — e.g. **Navy (DON) Phase I = 10 pages**. Set **Page Limit (Technical)** to the value your topic's component states.
- 2** **Format floor (BAA §1.4.b): no font smaller than 10-point**, 8.5×11 paper, **one-inch margins**, single column, single-spaced, a per-page header (SBC name · topic # · DSIP #). Set Font, Margins, Line Spacing and Header Required to match.
- 3** The **AI** pills mark fields Ingest Assist can pre-fill from an uploaded BAA — you confirm every value before Push.

Define the volumes and required items

Build the **Response Volumes** skeleton the proposer must produce — for DoW SBIR/STTR that is the full **six-volume DSIP set** (the sixth, FWA Training, is easy to miss).

The per-solicitation *Technical* document templates the builder authors (N261-EXP01, N26D-CAM07) — the section headings + the correct canvas bounds.

DoW 2026 SBIR — the six DSIP volumes

Vol	Volume	Items
1	Proposal Cover Sheet	DSIP webform
2	Technical Volume	12 sections — Identification & Significance → ... → assertion of data-rights restrictions (10-page limit)
3	Cost Volume	DSIP cost form
4	Company Commercialization Report	CCR webform
5	Supporting Documents	optional attachments
6	Fraud, Waste and Abuse Training	required for Phase I and Direct-to-Phase-II

The STTR Direct-to-Phase-II variant

The DoW 2026 STTR BAA produces a structurally different document — the same six volumes, but:

- 1 **Technical Volume = 30 pages**, split into a **Phase I Proof of Feasibility** portion (≤20pp) and a **Snapshot of Proposed Phase II Effort** (≤10pp).
- 2 **STTR work-split** in the compliance custom variables: a minimum **40%** of the work by the small business and **30%** by the single research institution, measured by direct + indirect costs (BAA §1.3).
- 3 Vol 5 carries the required **SBC ↔ RI Allocation-of-Rights** agreement.

Adversarial review, then Push

Before releasing, sanity-check the authored numbers against the BAA (page limit, font floor, volume count, the STTR split). Then **Push** — the fan-out puts the OPP card on every activated tenant's pipeline.

TSVF Round 39 - Technology Validation & Startup Fund - Ohio Third Reader - 2024	Open	8/10/2024	6	1	1 final	8/10/2024
SBR - Live Carbon Concrete & Cement Materials (2030-2035) - Strategic Project (2024-2030)	Open	8/10/2024	6	0	1 building	8/10/2024
Additive Construction of Expeditionary Structures (ACES) - U.S. Army - 2025 (Engineer Research & Development Center) - 2024	Open	9/10/2024	6	0	1 building	8/10/2024
TSVF R38 form-to verify Ohio Third Reader - 2024	Open	—	0	0	1 building	8/10/2024
DWH Direct-to-Phase II STRT - Autonomous Navigation Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
DWH SBR Phase I - AF Advanced Technical Protection Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
DWH Direct-to-Phase II STRT - Autonomous Navigation Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
DWH SBR Phase I - AF Advanced Technical Protection Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
DWH Direct-to-Phase II STRT - Autonomous Navigation Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
DWH SBR Phase I - AF Advanced Technical Protection Deployment of the Air Force - SBR - phase_3	Open	—	0	0	1 building	8/10/2024
Ohio TSVF Round 45 - Technology Validation & Startup - Ohio Third Reader - 2024	Open	—	0	0	1 building	8/10/2024
SBR - Additive Construction for Off-world habitats (2030-2035) - Strategic Project (2024-2030)	Open	9/10/2024	6	0	—	—
SBR Phase I - Advanced Manufacturing Construction A - National Science Foundation (2024-2030)	Open	8/10/2024	6	0	—	—
STRT - Robotics for the Built Environment (2030-2035) - National Science Foundation (2024-2030)	Open	9/10/2024	6	0	—	—

The two DoW OPP cards on the opportunity list after Push — SBIR (Navy Phase I) and STTR (Direct to Phase II).

Releases & SLA — the provisioning cockpit

WHERE `/admin/provisioning` · `/admin/provisioning/<portalId>`

This is the screen that **lands the 72-hour SLA**. A comp-code purchase creates a portal in `curation_pending`; it queues here until an RFP admin releases it. Reach it from the sidebar as **Releases & SLA** — the route is `/admin/provisioning`, and the `proposal_setup` `ToDo` on the purchase deep-links straight to the buyer's cockpit.

The two outcomes are deliberately different in scope. The build-out broadcast touches the **shared master** — every tenant sees the improved card. The provision touches **one buyer's private portal**. Segregation and continuity, in that order.

The tenant-side `?action=release` path and this cockpit call the same `provisionAndReleasePortal` helper, so the two routes cannot drift.

- 1 Open **Releases & SLA**. Purchased portals are sorted by their 72-hour curation clock, most urgent first. An empty queue says “*The release queue is clear.*” and links you to Purchases — that is the healthy state, not a fault.
- 2 Open a queued portal to reach its cockpit: the buyer, a live SLA countdown, and the master **build-out readiness bar** — compliance authored, at least one volume, at least one required item. The bar reads the master solicitation, not this buyer's copy.
- 3 If the master is not ready, follow the deep link into the authoring workspace and finish the build-out. A portal whose master is already built out can be released in one click.
- 4 Press **Complete & Release**. Two things happen in order: `completeBuildOut` marks the master built out and broadcasts an `updated` fan-out to **every** tenant's mirror card, then `provisionAndReleasePortal` provisions **this buyer's** private portal, flips `curation_pending` → `launched`, and starts their workflow.
- 5 Confirm the buyer now has an unlocked workspace with a populated compliance matrix, and a required **Workflow Setup** `ToDo` waiting for their tenant admin.

The release queue when it is clear — the empty state names the next action.

gowwin — RFP Pipeline Portal · RFP-Admin role. Canonical automation surface is /admin/workflows; /admin/process and /admin/processes are legacy lenses on the same runs. Companion guides: Customer-Admin, Collaborator.
