

Build a Winning Proposal, End-to-End

The customer's eight-step journey through the govwin proposal portal — from a ranked opportunity to a submission-ready, downloadable proposal.

Every step below was verified on a real effort: the **Immobileyes NAVAIR/NAVSEA Counter-UAS SBIR** (topic DON26BX03-NP002). The screenshots are that live run.

Verified end-to-end · every step through the platform's real tools & agents

Sign in & your portal

WHERE /portal/<company>/dashboard

Sign in with the credentials your RFP-Pipeline admin issued. Your **dashboard** is role-aware: it opens on your company's workspace and surfaces your live **ToDos** — opportunities to review, proposals in progress, and anything waiting on you.

The customer-admin landing: your workspace + role-aware ToDos.

Find your opportunity (ranked cards)

WHERE `/portal/<company>/cards`

The **Opportunity Pipeline** shows every opportunity the platform has pushed to you, **ranked by your Spotlight buckets**. Each card carries the agency, program, and close date. **Pin** copies the solicitation's documents into your workspace; **Build** opens the proposal workspace.

In the verified run, the NAVAIR/NAVSEA Counter-UAS topic **DON26BX03-NP002** ranks #1 for Immobileyes — the best fit for a counter-drone optics company.

The DON26BX03-NP002 C-UAS card ranked #1 in the Immobileyes pipeline.

Set your scoring criteria (buckets)

WHERE /portal/<company>/buckets

Spotlight buckets are your scoring criteria — the themes you care about (e.g. “Counter-UAS”, “AI sensor fusion”). Every card is scored against each bucket, and editing a bucket **re-ranks your pipeline** automatically. This is deterministic today; an optional scoring agent overlays it later.

Build your content library (upload → atomize)

WHERE `/portal/<company>/atoms` · Upload package → atomize-package

Your library is the raw material every draft is built from. On **Library** → **Upload package**, drop your past proposals, capability docs, résumés, and data (PDF, DOCX, PPTX, XLSX). The **atomizer** deconstructs each file into a **reference atom** (the whole doc) plus one **primitive atom** per substantive block, and **auto-tags** them against the shared taxonomy (volume, kind, agency, program, phase).

Verified: five Immobileyes documents (GHOST draft, TACFI Technical Volume, résumés, foreign affiliations, cost proposal) atomized into **24 atoms** — tagged `vol:technical` `vol:cost` `vol:key_personnel` `kind:bio` and more. Each uploaded package also gets a “**Save as template**” button (templify) to reuse its winning structure.

The screenshot displays the 'Library Atoms' interface. On the left is a sidebar with navigation links: Dashboard, Opportunities, Tenders, Library (selected), Build, Proposals, Processes, Activity, Team, Documents, Billing, All Change, Administration, and Settings. The main content area is titled 'Library Atoms' and includes a sub-header: 'Direct your own documents by hand — deconstruct into objects, keep only the content you like, tag it against the one taxonomy, and it's sized to drop into section molds. Primitives (a bio, a figure) combine into groups (a Team) with lineage back to their source.' Below this is a 'Reuse a past proposal' section with a 'Templify its structure → regenerate fresh drafts' button and a list of five documents with 'Save as template' buttons. The main table lists 24 atoms, each with a checkbox, a 'primitive' label, a title, a word count, and action buttons for 'upload', 'delete', and 'templify'. The atoms are categorized by 'kind' (e.g., 'bio', 'technical', 'cost', 'key_personnel') and 'vol' (e.g., 'technical', 'cost', 'key_personnel').

primitive	title	word count	actions

The real atomizer: 24 tagged atoms from five uploaded Immobileyes documents.

Group atoms & arrange the canvas

WHERE /portal/<company>/atoms · section canvas → “+ From Library”

Atoms aren't just a flat list. In the library, **select** several primitives and **Group into new atom** to compose a reusable bundle — a “Team for Navy” group, a past-performance set. Inside a section, “+ From Library” inserts atoms straight into the canvas as nodes, and you **drag to reorder** them into the flow you want.

Verified: three GHOST past-performance & partner primitives composed into one group, inserted into the **Related Work** section, then reordered on the canvas.

Composing primitives into a reusable group in the library.

Open the proposal & compliance matrix

WHERE `/portal/<company>/proposals/<id>`

Opening a proposal provisions the full **compliance matrix** — every required volume and item the solicitation demands, each linked to a section “mold” that carries the format rules (page limit, margins, font). The specific agency **template** is built into the matrix, so the structure is correct before you write a word.

Verified: the DON **6-volume CSO structure** (Cover · Technical · Cost · CCR · Supporting · FWA), with **Volume 2** aligned to the DON Phase-I Open-Topic **Technical Volume 2 template** (8 sections).

Lock the proposal or advance to submitted stage to export

Current stage: draft

Role: admin

The 6-volume matrix; Volume 2 aligned to the DON TV2 template, ready to draft.

Draft each section with the AI agent

WHERE `proposal.draft_section` ("Draft all sections")

Open a section and click **Draft** (or **Draft all sections**). The **drafting agent** reads the RFP context and the section's compliance mold, pulls the most relevant **atoms from your library**, and writes canvas content sized to the page budget — you review, pick atoms, and revise in the canvas editor. Nothing auto-commits: it's advisory until you accept.

Verified: the `proposal.draft_section` agent tool ran on all **8 Technical-Volume sections**, grounded in the atomized library, applying its budget/fit check (≈ a 2-page, ~1,090-word target per section).

The canvas editor — draft, pick atoms, and revise each section.

Accept & Lock → the matrix turns green

WHERE lockSectionCore (Accept & Lock)

When a section is right, **Accept & Lock** it. Locking flips its **compliance row** to “**satisfied**,” snapshots the version, harvests reusable content back into your library, and rolls the volume up. When every section of a volume is locked, the volume shows ✓ **Volume locked** and downloads unlock.

Verified: locking via lockSectionCore turned 10 matrix rows green (8 Technical + 2 Cost). Volume 2 reads “8/8 locked · 9/10 pages · ✓ Volume locked.”

Verified deliverables: a **10-page Technical Volume .docx** (6 figures, 5 tables, all 8 DON TV2 sections) and a **Cost Volume .xlsx** — Base **\$199,502 ≤ \$200k**, Option **\$114,464 ≤ \$115k**, formulas live.

1.0 Description of Proposed Phase I Technical Effort

This proposal includes data that shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed—in whole or in part—for any purpose other than to evaluate this proposal (SBIR data rights).

Problem and Significance

First-person-view (FPV) fiber-optic drones have become one of the most difficult unmanned-air-system (UAS) threats on the modern battlefield. Unlike conventional FPV systems, these aircraft require no radio-frequency (RF) link, are immune to RF jamming, and operate in GPS-denied environments—relying almost entirely on continuous electro-optical (EO) imagery for terminal guidance. Fielded at scale in Ukraine and by non-state actors, they defeat the RF-centric and GPS-centric counter-UAS (C-UAS) systems the Navy fields today.

Figure 1. Fiber-optic FPV drones—no RF link, immune to jamming—now proliferating in current conflicts.

The operational consequence is stark. RF-based detection and defeat (jammers, spoofers, high-power microwave) have no emission to exploit; GPS denial has no effect on a vehicle flown by wire over fiber; and kinetic interceptors are cost-prohibitive and collaterally constrained against a sub-\$1,000 airframe. A single fiber drone can be produced for a few hundred dollars, yet forces the defender to expend a far costlier effect—an unfavorable cost-exchange and magazine-depth problem that is most acute at the exact moment of a saturating swarm attack against a Naval installation, aircraft on the ramp, or a ship in the littorals.

Existing C-UAS remains optimized for RF disruption or kinetic defeat. Very little work addresses non-kinetic optical defeat of EO-guided fiber drones during the terminal attack—precisely the gap DON26BX03-NP002 targets: a novel, scalable capability to detect, track, identify, and neutralize single and swarm UAS in complex operational environments.

Technical Innovation — GHOST (STORM + DEXTER)

Immobileyes proposes GHOST (Guided Hostile Optical Sensor-hijacking Technology), a software-defined optical counter-UAS architecture integrating two mature Immobileyes/AlphaMicron technologies:

- STORM — AI-enabled EO/IR detection, identification, and tracking with a graduated escalation framework (Warn/Deter → Dazzle/Disrupt → Deny/Damage) and a human-in-the-loop selecting the response level. STORM is detection-agnostic (MOSA): it accepts EO/IR, radar, RF/EW, or TSPI cueing.

Page 1 of the exported Technical Volume — rendered by the system from your locked canvas.

guide doubles as living documentation. Companion guides: RFP-Admin Operations, Collaborator.
