

Run the Platform, End-to-End

The operator's journey: monitor sources, ingest and curate RFPs, push opportunities to customers, release their purchases, and oversee every workflow and agent from one console.

Screenshots are the live admin console. Where a customer's work needs a hand, you **shadow-descend** into their portal, do the work, and rise back up to ingest more — all as one account.

master_admin holds global access · every action is audited

Sign in & the admin landing

WHERE /admin · sign in as eric@rfppipeline.com

Sign in as your RFP-admin account. The landing is **role-aware**: it opens the operations console with your live **ToDo**s — purchases awaiting curation, RFPs mid-triage, and workflows parked on a human gate.

The seeded operator `eric@rfppipeline.com` is a **master_admin**: global access to every tenant plus the full admin surface. No per-tenant grant needed — it can dip into any company and rise back up to ingest.

Setup — source monitoring & scouts

WHERE /admin/sources · /admin/sources/<id> · /admin/scouts

Before anything is ingested, point the platform at where opportunities live. **Sources** defines the sites and feeds to watch; **Scouts** is the worker pool that visits them on a schedule, diffs the results, and surfaces new or changed solicitations. Configure regions to watch, run a scout on demand, and review the diffs.

Source monitoring profiles — the watched feeds that scouts sweep.

The scout worker pool

WHERE /admin/scouts

The **scout pool** shows each worker, its schedule, last run, and yield. Scouts run managed and audited — a run that fails on one source continues on the others. Newly discovered solicitations land in the intake queue for triage.

The scout worker pool — scheduled discovery across all sources.

Ingest — upload an RFP

WHERE /admin/rfp-curation/upload

To bring a solicitation in by hand, use **Upload**. Drop the solicitation PDF(s); the ingestor extracts text (with an ingest-assist pass), de-duplicates against existing solicitations, and stages the documents in object storage. It handles multi-document packages and marks a primary.

Malformed source PDFs (odd fonts, embedded control characters) are sanitized on the way in — the atomizer and ingestor strip invalid bytes so a bad file can't poison downstream text.

RFP Curation / upload

[← Back to Triage Queue](#)

Upload RFP

Upload one or more documents for a solicitation. The first PDF becomes the source document; additional files are stored as attachments (amendments, Q&A, templates). The shredder will extract text and the AI will pre-analyze compliance — then you curate.

Solicitation Metadata

Title *

DoD SBIR 26.1 Annual Program BAA

Agency *

Department of Defense

Program Office

AFWERX, DEVCOM, ONR...

Select...

Solicitation Number

e.g. DoD-SBIR-26.1

Posted Date

mm/dd/yyyy

Close Date

mm/dd/yyyy

Description / Notes

Optional — additional context about this solicitation.

Documents

Drag & drop files here, or [browse](#)

First PDF becomes the source document. Additional files stored as attachments.
PDF, Word, Excel, PowerPoint, plain text. Max 30 MB total.

☒ ⚡ Run Ingest Assist after upload

Parse the solicitation and auto-build the compliance matrix, volumes & section molds, then publish the opportunity card(s). You'll land in the curation workspace with it ready to review.

Upload & Ingest Assist

Cancel

Uploading a solicitation package into curation.

Curate — triage, topics, compliance, skeleton

WHERE /admin/rfp-curation · /admin/rfp-curation/<solId> · .../topic/<topicId>

Curation is the heart of the operator's work. Open a solicitation to **triage** it, extract its **topics** (umbrella + every sub-topic), attach the **compliance** requirements (from a preset or suggested), and build the section **skeleton** that becomes each proposal's matrix. Apply a preset to one topic or fan it to all.

Verified on DON26BX03-NP002: triaged, topics extracted, the DON 6-volume CSO compliance attached, and the Technical Volume 2 skeleton linked to its template mold.

The curation workspace — triage, topics, compliance, and skeleton.

Templates & molds studio

WHERE /admin/templates · /admin/templates/<id>/edit

The **Template Studio** is where section molds live — the format contracts (page limit, margins, font, required structure) a required item points at. Author a template on the canvas, or **templify** a winning past proposal into a reusable skeleton, then attach it to a compliance item so every provisioned proposal inherits the right shape.

The Template Studio — section molds and templified skeletons.

Push opportunities to customers

WHERE /admin/opportunities · /admin/cards

When a solicitation is curated, **push** it. The push fans **every activated opportunity** (umbrella + all topics) across the forward-only opportunity bridge into a denormalized card for every tenant, auto-scored against each tenant's buckets on arrival. This is the discovery release — customers now see the opportunity ranked in their pipeline.

Verified: the C-UAS topic pushed to Immobileyes ranked #1 in their pipeline within the same run.

Opportunities

Opportunity Rollup

Cross-portal status by opportunity — ranked & pinned across customers, and every proposal's build stage. One immutable opportunity, rolled up.

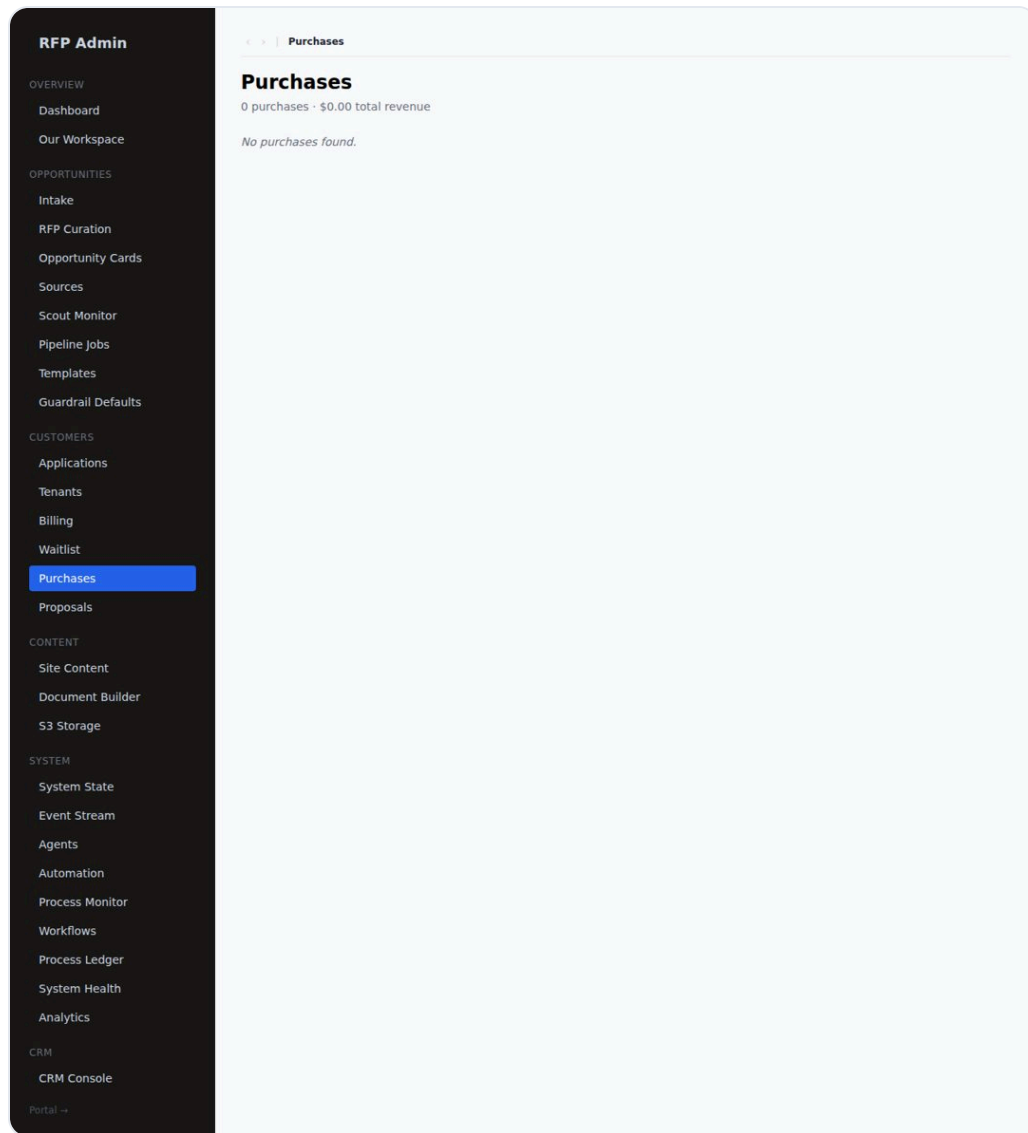

OPPORTUNITY	LIFECYCLE	CLOSE	RANKED	PINNED	PROPOSALS	LAST ACTIVITY
EZE Navy SBIR	open	—	0	0	1 building	7/16/2026

Activated opportunities — the push fans them onto every tenant's cards.

Purchases & the curation release (72h SLA)

WHERE `/admin/purchases` · `/admin/applications`

When a customer buys a proposal portal with a comp code, it lands in **Purchases** as `curation_pending` with a **72-hour SLA**. You **release** it from the shadow account: releasing provisions the build **unlocked** and instantiates the compliance matrix + molds from the master solicitation. This is the second release over the bridge — the proposal-portal build.

The purchase queue — comp-code buys awaiting curation release.

Monitor — the workflow catalog & instances

WHERE `/admin/workflows`

Every automation runs as a **managed workflow** — no fire-and-forget. **Workflows** is the canonical control surface: the roster of templates with an activation toggle, plus live instances with a per-step progress bar, transition timeline, and outcomes. A step that fails continues on independent branches; a **human gate** (HITL / ToDo) parks the instance until you advance it.

From an instance you can **advance**, **retry**, or **cancel**. A paused instance shows exactly which gate it's waiting on and who it's assigned to.

The screenshot displays the 'Workflow Monitor' interface. On the left is a dark sidebar with a navigation menu. The main content area is titled 'Workflow Monitor' and includes a subtitle 'Workflow instance tracking and management'. It features two primary sections: 'Generate Content' and 'Launch Review Gate', each with a form for creating or configuring a workflow. Below these forms is a status summary bar showing counts for Running (1), Paused (1), Completed (24h 0), and Failed (24h 0) workflows. The 'Active Workflows' section lists two instances: 'on_application_accepted' (running) and 'on_proposal_advanced' (paused). The 'Recent History (24h)' section shows no completed workflows.

Workflow Monitor
Workflow instance tracking and management

[Process Monitor](#) [Back to Dashboard](#)

Generate Content

Launch the CMS content vertical — AI drafts the body, then it parks at a review ToDo for approval before publishing.

Title * Content type

Brief *

The AI drafts the body from this. Falls back to the brief verbatim if no model key is configured.

Slug (optional)

[Generate Content](#)

Launch Review Gate

Park a manual HITL review/approval (ProjectCollaboration) on an entity. The task lands in the assignee's queue and is nudged toward its due date. For on-off gates not covered by an automatic bridge.

Scope Assign to role Due in (hours)

Task title *

Task type * Entity type *

Opportunity ID * (spine key, UUID) Entity ref * (the entity's UUID)

Proposal ID (optional, UUID) Tenant ID (optional — blank = admin gate)

[Launch Review Gate](#)

● Running 1 ● Paused 1 ● Completed 24h 0 ● Failed 24h 0

Active Workflows

● on_application_accepted running Backfill Cards Step 1/2 26h 35m [Steps](#) [Cancel](#)

● on_proposal_advanced paused Wait For Review Step 2/3 tenant: 2f648f93... 26h 50m [Steps](#) [Advance](#) [Cancel](#)

Recent History (24h)

No completed workflows in the last 24 hours

The workflow catalog + live instances — see and control every automation.

Monitor — the agent workforce

WHERE /admin/agents · /admin/guardrail-defaults

Agents is the workforce roster: each archetype, whether it's awake, and its per-tenant usage over the forward-only bridge. Tenant-space agents are **tenant-bound** and **advisory** — they propose, a guardrail checks, and a human accepts; they never auto-write business tables. **Guardrail defaults** sets the safety envelope (round/cost/rate/budget caps) every agent runs inside.

[illegible]

The agent workforce roster with per-tenant usage.

Monitor — events, automation, processes

WHERE /admin/events · /admin/automation · /admin/process · /admin/processes

Cross-board observability: **Events** is the immutable stream (every state-changing action emits start → end); **Automation** is the rules engine with its run logs; **Process** / **Processes** are event-based monitors of active instances. Use these to answer “what happened, when, and did it finish?” for any run on either side of the bridge.

Naming overlap to know: `/admin/process` (event monitor), `/admin/processes` (instance ledger), and `/admin/workflows` (canonical) view the same runs. Treat `/admin/workflows` as primary.

Monitor — system state & analytics

WHERE /admin/system-state · /admin/analytics · /admin/storage

System state is the health board (services, storage, migrations); **Analytics** rolls up usage across tenants and opportunities. Together they tell you the platform is healthy and where the activity is.

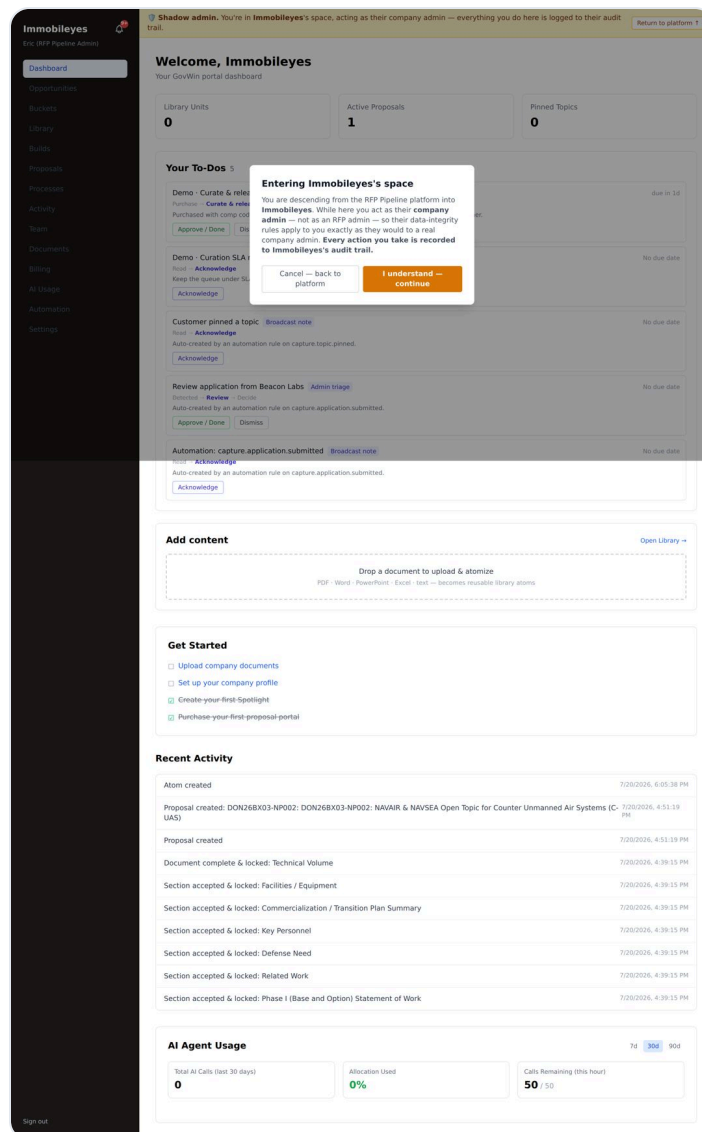

The system-state health board.

Tenants oversight & shadow-descend

WHERE `/admin/tenants` · `/admin/tenants/<id>`

Tenants is the roster of every company on the platform. From a tenant you can review its state, backfill its cards, and — the operator's superpower — **shadow-descend** into its portal to do work on its behalf (build a library, draft a section, unstick a proposal), then rise back up to the admin surface to ingest more. The session rewrites to **tenant_admin** inside the portal and a shadow banner marks the descent; every action stays audited.

Verified: `eric@rfppipeline.com` descends into `/portal/immobileyes/*` (shadow banner shown), works the proposal, and returns to `/admin`. One account, both jobs.

Shadow-descend: the RFP admin working inside the Immobileyes portal, banner shown.

gowwin — RFP Pipeline Portal · RFP-Admin role. Canonical automation surface is `/admin/workflows`; `/admin/process` (event monitor) and `/admin/processes` (instance ledger) are legacy views of the same runs. Companion guides: Customer-Admin,

Collaborator.
